5.5 Asymmetric Crypto Functions	19
5.6 Open, Read, Write, Close On Secure Storage	21
5.7 API Error Codes and its values	22
<b>6 Preparation and building ta-ref with docker</b>	<b>23</b>
6.1 Preparation	23
6.1.1 Installing Docker	23
6.1.2 Executing Docker without sudo	23
6.1.3 Create a docker network tamproto	24
6.2 Docker images details	24
6.3 Building ta-ref with Docker	24
6.3.1 Building ta-ref for Keystone with docker	24
6.3.2 Building ta-ref for OP-TEE with docker	26
6.3.3 Building ta-ref for Intel SGX with docker	28

<b>7 Preparation before building ta-ref without Docker</b>	<b>31</b>
7.1 Keystone(RISC-V Unleashed)	31
7.1.1 Required Packages	31
7.1.2 Download RISC-V toolchain and Keystone SDK	31
7.1.3 Run Keystone examples	32
7.2 OP-TEE (ARM64 Raspberry Pi 3 Model B)	33
7.2.1 Required Packages	33
7.2.2 Download and build OP-TEE Toolchains 3.10.0	33
7.2.3 Download OP-TEE 3.10.0	34
7.2.4 Build OP-TEE 3.10.0	34
7.2.5 Run OP-TEE Examples	35
7.3 SGX (Intel NUC)	35
7.3.1 List of machines which are confirmed to work	36
7.3.2 BIOS Versions which are failed or succeeded in IAS Test	36
7.3.3 BIOS Settings	36
7.3.4 Required Packages	36
7.3.5 Build SGX	36
7.3.6 Run sgx-ra-sample	38
7.4 Doxygen	41
7.4.1 Required Packages	41
7.4.2 Build and Install Doxygen	41
7.5 Customizing MbedTLS Configuration file	41
7.5.1 What can be customized?	41
7.5.2 mbedtls configuration file (config.h)	41
7.5.3 Supplement Investigation information	43
<b>8 Building ta-ref without Docker</b>	<b>43</b>
8.1 ta-ref with Keystone	43
8.1.1 Cloning source and building	43
8.1.2 Check ta-ref by running test_gp, test_hello, on QEMU	44
8.2 ta-ref with OP-TEE	46
8.2.1 Cloning source and building	46
8.2.2 Check ta-ref by running test_gp, test_hello, on QEMU	46
8.3 ta-ref with SGX	47
8.3.1 Cloning source and building	47
8.3.2 Check ta-ref by running test_gp, test_hello, simulation mode on any pc	48
8.4 Generating ta-ref.pdf with Doxygen	49
8.4.1 Cloning source and building docs	50
<b>9 Running on Development Boards</b>	<b>50</b>
9.1 Keystone, Unleashed	50
9.1.1 Preparation of rootfs on SD Card	50
9.1.2 Copying binaries of test_hello and test_gp	51

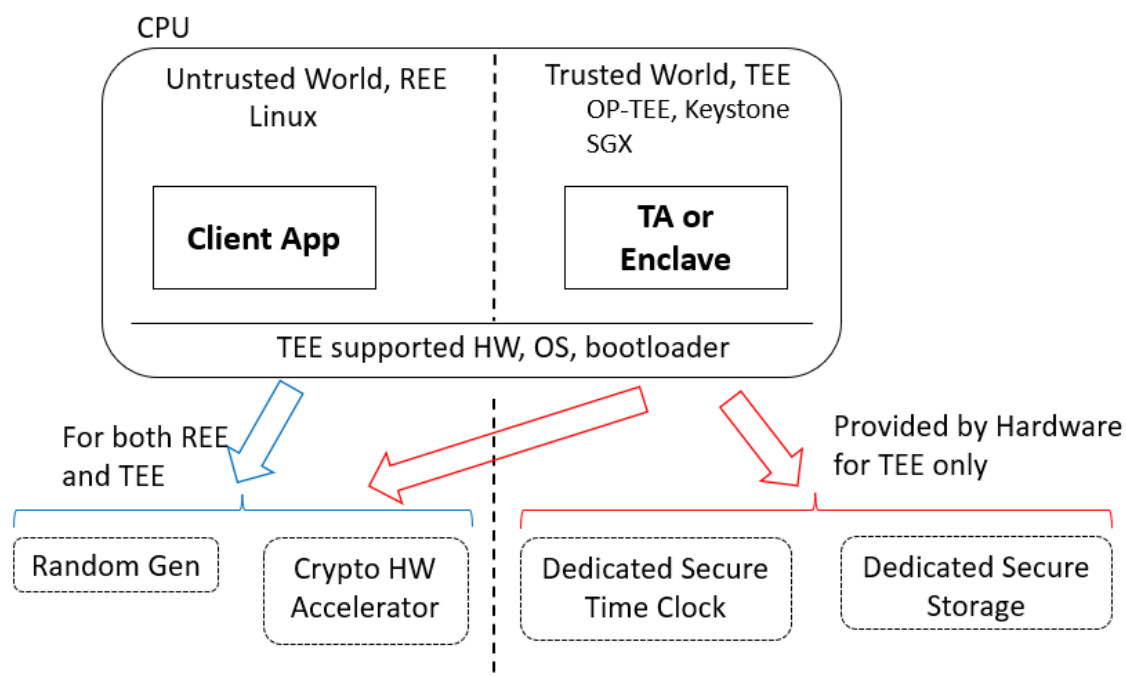

9.1.3 Check test_hello and test_gp on Unleased	52
9.2 OP-TEE, RPI3	53
9.2.1 Preparation of rootfs on SD Card	53
9.2.2 Copying binaries of test_hello and test_gp to rootfs partition	54
9.2.3 Check test_hello and test_gp	55
9.3 SGX, NUC	56
9.3.1 Copying binaries of test_hello and test_gp to NUC machine	56
9.3.2 Check test_hello and test_gp	56

## 1 Overview of TA-Ref

### 1.1 Features of TA-Ref

- Provides Portable API and SDK among Intel SGX, ARM TrustZone-A and RISC-V Keystone
- Provides portability for source codes of Trusted Applications among SGX, TrustZone and Keystone
- Provides subset of Global Platform API

#### 1.1.1 Hardware Features of TA-Ref on TEE

## 1.2 Components of TA-Ref

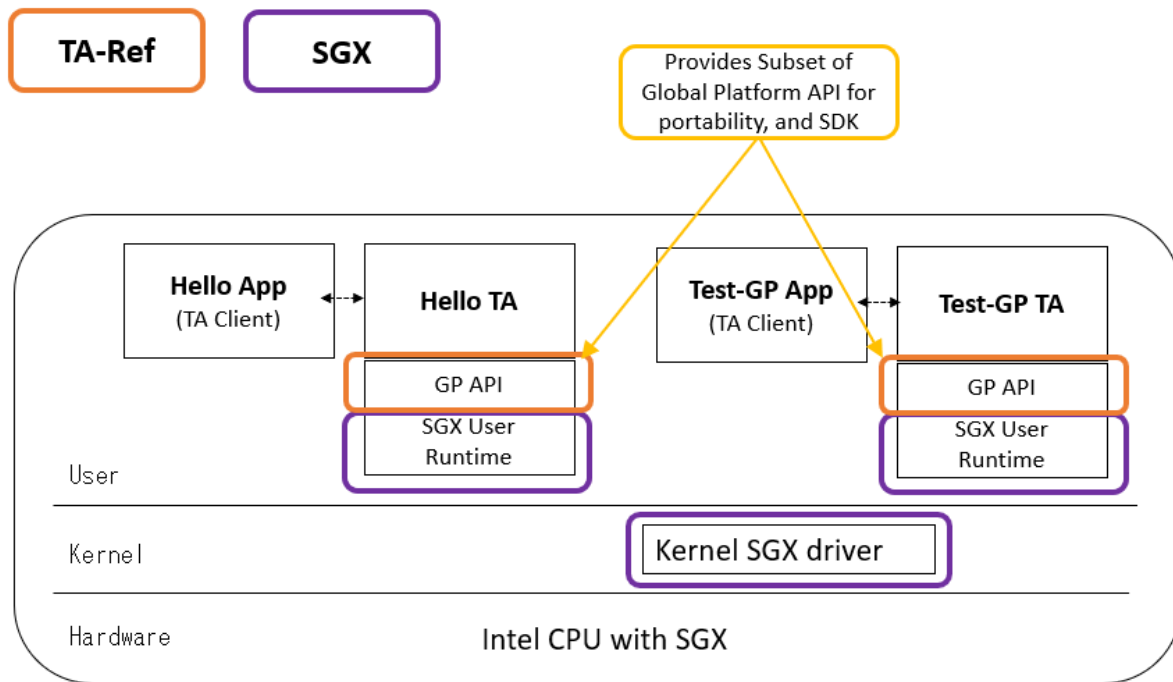

### 1.2.1 TA-Ref Components on Keystone

### 1.2.2 TA-Ref Components on OP-TEE

## 1.2.3 TA-Ref Components on SGX

## 1.3 What we did on RISC-V

- We designed the GP internal API library to be portable.
- Keystone SDK is utilized because of runtime "Eyrie".
- The library is ported to Intel SGX as well as RISC-V Keystone.

## 1.3.1 Challenges faced during Implementation

- The combination of GP internal API and cipher suite is big.
  - To reduce the size, We pick up some important GP internal APIs.
- Some APIs depend on CPU architecture.
  - We separate APIs into CPU architecture dependent / independent.
- Integrate GP TEE Internal API to Keystone SDK.
  - Keystone SDK includes EDL (Enclave Definition Language) named "keedger".
  - Keedger creates the code for OCALL (request from TEE to REE) to check the pointer and boundary.

### 1.3.2 Selected GP TEE Internal API's for testing

- CPU architecture dependent
  - Random Generator, Time, Secure Storage, Transient Object(TEE\_GenerateKey)
- CPU architecture independent(Crypto)
  - Transient Object(exclude TEE\_GenerateKey), Crypto Common, Authenticated Encryption, Symmetric/Asymmetric Cipher, Message Digest

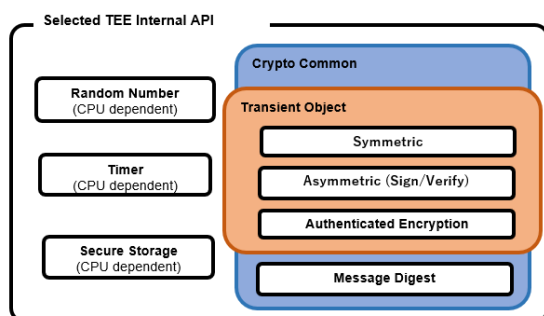

Following shows the table of CPU Dependent and Independent API's with its functions.

Category	CPU (In)Dependent	Functions
Random Number	Dependent	TEE_GenerateRandom
Time	Dependent	TEE_GetRETime, TEE_GetSystemTime
Secure Storage	Dependent	TEE_CreatePersistentObject, TEE_OpenPersistentObject, TEE_ReadObjectData, TEE_WriteObjectData, TEE_CloseObject
Transient Object	Dependent Independent	TEE_GenerateKey, TEE_AllocateTransientObject, TEE_FreeTransientObject, TEE_InitRefAttribute, TEE_InitValueAttribute, TEE_SetOperationKey
Crypto Common	Independent	TEE_AllocateOperation, TEE_FreeOperation
Authenticated Encryption	Independent	TEE_AEInit, TEE_AEUpdateAAD, TEE_AEUpdate, TEE_AEEncryptFinal, TEE_AEDecryptFinal
Symmetric Cipher	Independent	TEE_CipherInit, TEE_CipherUpdate, TEE_CipherDoFinal
Asymmetric Cipher	Independent	TEE_AsymmetricSignDigest, TEE_AsymmetricVerifyDigest
Message Digest	Independent	TEE_DigestUpdate, TEE_DigestDoFinal

## 1.4 Dependency of category

### Dependency of category

- Some categories have dependency.
  - Crypto Common
    - Cipher suite must be registered before use.
  - Transient Object
    - The space for a key must be prepared before use.

#### Sample Program

```
// Allocate a transient object for keypair
TEE_AllocateTransientObject(TEE_TYPE_ECDSA_KEYPAIR,
    KEY_SIZE, &keypair);
// Assemble an attribute for ecc key
TEE_InitValueAttribute(&attr, TEE_ATTR_ECDSA_KEYPAIR,
    TEE_ECC_CURVE_NIST_P256, KEY_SIZE);
// Generate a keypair having that attribute
TEE_GenerateKey(keypair, KEY_SIZE, &attr, 1);
```

```
// Allocate sign operation
TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256,
    TEE_MODE_SIGN, KEY_SIZE);
```

```
// Set the generated key to the sign operation
TEE_SetOperationKey(handle, keypair);
```

```
// Sign
uint32_t siglen = SIG_LENGTH;
TEE_AsymmetricSignDigest(handle, NULL, 0, hash,
    hashlen, sig, &siglen);
```

```
// Free handle for the sign operation
TEE_FreeOperation(handle);
```

  Crypto Common
   Transient Object
   Asymmetric (Sign/Verify)

## 2 API comparison with full set of GP API

### 2.1 GP API

#### API Functions by Category

#### APIs supported by both GP and AIST-GP are in Blue

API list from TEE Internal Core API Specification documentation, GlobalPlatform Technology

Asymmetric	<a href="#">TEE_FreeOperation</a>
<a href="#">TEE_AsymmetricDecrypt</a>	<a href="#">TEE_GetOperationInfo</a>
<a href="#">TEE_AsymmetricEncrypt</a>	<a href="#">TEE_GetOperationInfoMultiple</a>
<a href="#">TEE_AsymmetricSignDigest</a>	<a href="#">TEE_IsAlgorithmSupported</a>
<a href="#">TEE_AsymmetricVerifyDigest</a>	<a href="#">TEE_ResetOperation</a>
Authenticated Encryption	<a href="#">TEE_SetOperationKey</a>

- TEE\_ResetTransientObject

### 3 How to run sample TA programs on ta-ref

Currently ta-ref supports writing TA's for three targets namely

- Keystone
- OP-TEE
- Intel SGX

The pre-built ta-ref docker images for all three targets are already available. The details are mentioned below

Target	docker image
Keystone	trasioteam/taref-dev:keystone
OP-TEE	trasioteam/taref-dev:optee
Intel SGX	trasioteam/taref-dev:sgx

#### 3.1 Run samples for Keystone

Sample to be executed : **message\_digest**

Docker Image : **trasioteam/taref-dev:keystone**

Following are the steps to be executed to run samples for Keystone.

```
# Pull the docker image
$ docker pull trasioteam/taref-dev:keystone

#Run the docker image
$ docker run -it trasioteam/taref-dev:keystone

# [Inside docker image]
# Initially you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.

# Changes to ta-ref folder
$ cd ${TAREF_DIR}

# Move to keystone build directory
$ cd samples/message_digest/build-keystone/

# Make the message-digest sample
$ make

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root
# Password: sifive

# [Inside Qemu Console]
# Execute the sample and see the output
# Load the keystone driver
$ insmod keystone-driver.ko

# Run the message-digest program
$ ./App-keystone

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

Following is the output inside qemu when you execute the sample program.

```
# insmod keystone-driver.ko
[ 90.867089] keystone_driver: loading out-of-tree module taints kernel.
[ 90.877175] keystone_enclave: keystone enclave v1.0.0
#
# ./App-keystone
[debug] UTM : 0xffffffff80000000-0xffffffff80100000 (1024 KB) (boot.c:127)
[debug] DRAM: 0x179800000-0x179c00000 (4096 KB) (boot.c:128)

3c
TEE_OpenPersistentObject(): start
TEE_ReadObjectData(): start
TEE_CloseObject(): start
hash: matched!
main end
#
```

## 3.2 Run samples for OP-TEE

Sample to be executed : **message\_digest**

Docker Image : **trasioteam/taref-dev:optee**

Following are the steps to be executed to run samples for OP-TEE.

```
# Pull the docker image
$ docker pull trasio team/taref-dev:optee

# Run the docker image
$ docker run -it trasio team/taref-dev:optee

# [Inside docker image]
# Initially you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.
$ cd ${TAREF_DIR}

# Move to Optee build directory
$ cd samples/message_digest/build-optee/

# Make the message-digest sample
$ make

# Make the qemu
make install_qemu

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root

# [Inside Qemu Console]
# Execute the sample and see the output
# Run the message-digest program
./App-optee
```

```
# The output of the program is not displayed inside qemu.
# Inside the docker, it cannot open two console, one for Linux and one for optee,
# so saving the console output to file for optee. It is saved inside the serial.log

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

To view the output, open the serial log file by executing the following command outside qemu.

```
$ cat /home/user/optee/out/bin/serial1.log

hash: be 45 cb 26 05 bf 36 be bd e6 84 84 1a 28 f0 fd 43 c6 98 50 a3 dc e5 fe db a6 99 28 ee 3a 89

D/TC:? 0 tee_ta_close_session:518 Destroy session
#
```

### 3.3 Run samples for Intel SGX

Sample to be executed : **message\_digest**

Docker Image : **trasioteam/taref-dev:sgx**

Following are the steps to be executed to run samples for SGX.

```
# Pull the docker image
$ docker pull trasioteam/taref-dev:sgx

# Run the docker image
$ docker run -it trasioteam/taref-dev:sgx

# [Inside docker image]
# Initially you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.
$ cd ${TAREF_DIR}

# Move to SGX build directory
$ cd samples/message_digest/build-sgx/

# Make the message-digest sample for Simulation mode
$ make
# This creates the App_sgx and enclave.signed.so
# You can copy this two files alone to any places and run the App_sgx
$ ./App_sgx
```

Trimmed the output in the App\_sgx shown below

```
.
.
[read_cpusvn_file ../cpusvn_util.cpp:96] Couldn't find/open the configuration file

exit

```

## 4 How to write your first 'Hello World' TA Program

To understand how to write TA, We are going to write a simple 'Hello World' TA program. The objective of the program is to print the text 'Hello World'.

To do that, first we will copy the existing sample program from `ta-ref samples` directory

Have a look on the directory structure of sample program inside `ta-ref` directory.

```

build-user@39ddcd17144c:~/ta-ref$ tree hello_world_ta/
hello_world_ta/
├── App-keystone.cpp
├── App-optee.c
├── App-sgx.cpp
├── build-keystone
│   └── Makefile
├── build-optee
│   ├── app.mk
│   ├── enclave.mk
│   ├── Makefile
│   ├── sub.mk
│   └── user_ta_header_defines.h
├── build-sgx
│   ├── app.mk
│   ├── config
│   │   └── Enclave.config.xml
│   ├── Enclave.lds
│   ├── enclave.mk
│   ├── Enclave_private.pem
│   └── Makefile
└── Enclave.c

```

Basically we need to modify two files

- 1) Enclave.c (Common to all three targets)
- 2) App-<target>.c

- App-keystone.cpp (Incase of Keystone)
- App-optee.c (Incase of OP-TEE)
- App-sgx.cpp (Incase of SGX)

### 4.1 Writing 'Hello World' TA for Keystone

#### Step 1: Run the docker image

Run the `ta-ref` pre-built docker for keystone.

```
# Download / Refresh the docker image
$ docker pull trasioteam/taref-dev:keystone

# Run the docker image
$ docker run -it trasioteam/taref-dev:keystone
```

### Step 2: Copy sample directory and modify

Copy the sample 'message\_digest' and rename to the name you need. Here, we are naming it to `hello_world_ta`

```
$ cd ${USER_DIR}
$ cp -r ${TAREF_DIR}/samples/message_digest/ hello_world_ta
$ cd hello_world_ta
```

### Step 3 : Modifications to Enclave.c (Common to all three targets)

`Enclave.c` is the place where we write the business logic. In our case, our business logic is to print the text 'Hello World'.

Look for the `#define` statement `TA_InvokeCommandEntryPoint()` function. This is the place we are going to modify

Before modification

```
#define TA_REF_HASH_GEN      0x11111111
#define TA_REF_HASH_CHECK   0x22222222
TEE_Result TA_InvokeCommandEntryPoint(void *sess_ctx,
                                      uint32_t cmd_id,
                                      uint32_t param_types, TEE_Param params[4])
{
    int ret = TEE_SUCCESS;
    switch (cmd_id) {
        case TA_REF_HASH_GEN:
            message_digest_gen();
            return TEE_SUCCESS;
        case TA_REF_HASH_CHECK:
            ret = message_digest_check();
            if (ret != TEE_SUCCESS)
                ret = TEE_ERROR_SIGNATURE_INVALID;
            return ret;
        default:
            return TEE_ERROR_BAD_PARAMETERS;
    }
}
```

After Modification

```
#define TA_REF_PRINT_HELLO   0x11111111
TEE_Result TA_InvokeCommandEntryPoint(void *sess_ctx,
                                      uint32_t cmd_id,
                                      uint32_t param_types, TEE_Param params[4])
{
    int ret = TEE_SUCCESS;
    switch (cmd_id) {
        case TA_REF_PRINT_HELLO:
            tee_printf("Hello World \n");
            return TEE_SUCCESS;
        default:
            return TEE_ERROR_BAD_PARAMETERS;
    }
}
```

In the modification, we have removed the existing switch cases and added a new case to print 'Hello World' text. Various functions available to be used here are shown in Chapter 2 and few important functions are explained in detail below.

Please save your changes and exit `Enclave.c`

### Step 4 : Modifications to App-keystone.c

`App-keystone.cpp` is the main function which invokes `Enclave.c`. The objective is to call the `TA_InvokeCommandEntryPoint()` which we modified in the previous step.

Before Modification

```

#define TA_REF_HASH_GEN      0x11111111
#define TA_REF_HASH_CHECK   0x22222222
// Inside main() function
run_enclave(TA_REF_HASH_GEN);
run_enclave(TA_REF_HASH_CHECK);

```

#### After modification

```

#define TA_REF_PRINT_HELLO    0x11111111
// Inside main() function
run_enclave(TA_REF_PRINT_HELLO);

```

### Step 5: Execute the 'Hello World' TA for Keystone

Change directory to the build-keystone directory.

```

# Change to build-<target> directory
$ cd build-keystone

# Make the TA
$ make

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root
# Password: sifive
#

# [Inside Qemu Console]
# Execute the sample and see the output
# Load the keystone driver
$ insmod keystone-driver.ko

# Run the message-digest program
$ ./App-keystone
# [Output log printing Hello world]
[debug] UTM : 0xffffffff80000000-0xffffffff80100000 (1024 KB) (boot.c:127)
[debug] DRAM: 0x179800000-0x179c00000 (4096 KB) (boot.c:128)
[debug] FREE: 0x1799dd000-0x179c00000 (2188 KB), va 0xfffffffff001dd000 (boot.c:133)
[debug] eyrie boot finished. drop to the user land ... (boot.c:172)
main start
Hello World
main end
# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x

```

Here you can see the text 'Hello World' printed in the log.

## 4.2 Writing 'Hello World' TA for OP-TEE

### Step 1: Run the docker image

Run the ta-ref pre-built docker for optee.

```

# Download / Refresh the docker image
$ docker pull trasioteam/taref-dev:optee

# Run the docker image
$ docker run -it trasioteam/taref-dev:optee

```

### Step 2: Copy sample directory and modify

Copy the sample 'message\_digest' and rename to the name you need. Here, we are naming it to `hello_world_ta`

```
$ cd ${USER_DIR}
$ cp -r ${TAREF_DIR}/samples/message_digest/ hello_world_ta
$ cd hello_world_ta
```

### Step 3 : Modifications to Enclave.c

The modification is same as Keystone. So please refer the Step 3 of Writing 'Hello World' TA for keystone.

### Step 4 : Modification to App-optee.cpp

App-optee.c is the main function which invokes Enclave.c. The objective is to call the `TA_InvokeCommandEntryPoint()` which we modified in the previous step.

Look for the `#define` statement and `main (void)` function in the program

Before modification

```
#define TA_REF_HASH_GEN    0x11111111
#define TA_REF_HASH_CHECK 0x22222222
// Inside main(void) function
res = TEEC_InvokeCommand(&sess, TA_REF_HASH_GEN, &op,
                        &err_origin);
res = TEEC_InvokeCommand(&sess, TA_REF_HASH_CHECK, &op,
                        &err_origin);
```

After modification

```
#define TA_REF_PRINT_HELLO    0x11111111
// Inside main(void) function
res = TEEC_InvokeCommand(&sess, TA_REF_PRINT_HELLO, &op,
                        &err_origin);
```

### Step 5: Execute the 'Hello World' TA for OP-TEE

Change directory to the `build-optee` directory.

```
# Change to build-<target> directory
$ cd build-optee

# Make the TA
$ make

# After successful make of TA, Make the qemu
$ make install_qemu

# Run the qemu console
$ make run-qemu
# This opens us qemu console and login using
# buildroot login: root

# [Inside Qemu Console]
# Execute the create TA program
# No output is shown inside qemu, its stored in serial.log
# ./App-optee

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

To view the output, open the serial log file by executing the following command outside qemu.

```
$ cat /home/user/optee/out/bin/serial1.log

[Trimmed output]
D/TC:? 0 tee_ta_close_session:518 Destroy session
**Hello World**
D/TC:? 0 tee_ta_close_session:499 csess 0x3293e860 id 1
D/TC:? 0 tee_ta_close_session:518 Destroy session
```

Here you can see the text 'Hello World' printed in the log.

## 4.3 Writing 'Hello World' TA for Intel SGX

### Step 1: Run the docker image

Run the ta-ref pre-built docker for sgx.

```
# Download / Refresh the docker image
$ docker pull trasioteam/taref-dev:sgx

# Run the docker image
$ docker run -it trasioteam/taref-dev:sgx
```

### Step 2: Copy sample directory and modify

Copy the sample 'message\_digest' and rename to the name you need. Here, we are naming it to `hello_world_ta`

```
$ cd ${USER_DIR}
$ cp -r ${TAREF_DIR}/samples/message_digest/ hello_world_ta
$ cd hello_world_ta
```

### Step 3 : Modifications to Enclave.c

The modification is same as Keystone. So please refer the Step 3 of Writing 'Hello World' TA for keystone.

### Step 4 : Modification to App-sgx.cpp

App-sgx.c is the main function which invokes Enclave.c. The objective is to call the `TA_InvokeCommandEntryPoint()` which we modified in the previous step.

Look for the `#define` statement and `main(void)` function in the program

Before modification

```
#define TA_REF_HASH_GEN    0x11111111
#define TA_REF_HASH_CHECK 0x22222222
// Inside main(void) function
/* Calling Trusted Application */
ret = ecall_ta_main(global_eid, TA_REF_HASH_GEN);
if (ret != SGX_SUCCESS)
    goto main_out;
ret = ecall_ta_main(global_eid, TA_REF_HASH_CHECK);
if (ret != SGX_SUCCESS)
    goto main_out;
```

After modification

```
#define TA_REF_PRINT_HELLO    0x11111111
// Inside main(void) function
/* Calling Trusted Application */
ret = ecall_ta_main(global_eid, TA_REF_PRINT_HELLO);
if (ret != SGX_SUCCESS)
    goto main_out;
```

### Step 5: Execute the 'Hello World' TA for Intel SGX

Change directory to the `build-sgx` directory.

```
# Change to build-<target> directory
$ cd build-sgx

# Make the message-digest sample for Simulation mode
$ make

# This creates the App_sgx and enclave.signed.so
# You can copy this two files alone to any places and run the App_sgx
$ ./App_sgx

# [Trimmed Output]
main start
Hello World
main end
Info: Enclave successfully returned.
```

Here you can see the text 'Hello World' printed in the log.

## 5 AIST supported GP API's in TA's

Following are the set of AIST supported GP API's that can be used when writing your own TA is shown below.

### 5.1 Time Functions

/\*\*

- ree\_time\_get() - Retrieves the current REE system time.
- 
- Retrieves the current time as seen from the point of view of the REE which
- typically runs on Linux/Android or Windows with gettimeofday().
- It is not safe to use the value of TEE\_GetREETime() in TEE for security
- sensitive purposes but it is a good way to check what the apps on REE
- see the current time is.
- 

#### Returns

- returns time value from OS running on REE \*/

```
struct timeval ree_time_get(void)
{
    TEE_Time time;
    struct timeval tv;
    /* REE time */
    TEE_GetREETime(&time);
    tee_printf("@GP REE time %u sec %u millis\n", time.seconds, time.millis);
    tv.tv_sec = time.seconds, tv.tv_usec = time.millis * 1000;
    return tv;
}
```

/\*\*

- tee\_time\_get() - Retrieves the current secure system time for the usage in TEE.
- 
- The TEE\_GetSystemTime() returns the time value which is not able to be
- changed by User Applications on the REE side, but returns a tamper safe
- time value which normally requires hardware implementation with a separate
- RTC chip in the area where OS on REE can not access it and backed up with
- shield battery. The secure system is for security sensitive operations,
- such as checking expiration date of certificates and keys.
- 

#### Returns

- returns time value for the usage in TEE \*/

```

struct timeval tee_time_get(void)
{
    TEE_Time time;
    struct timeval tv;
    /* System time */
    TEE_GetSystemTime(&time);
    tee_printf("@GP Secure time %u sec %u millis\n", time.seconds, time.millis);
    tv.tv_sec = time.seconds, tv.tv_usec = time.millis * 1000;
    return tv;
}

```

## 5.2 Random Functions

/\*\*

- tee\_random\_get() - Generates the random value for secure operation in TEE.
- 
- It returns the closest value to the true random generator but the quality
- of the randomness depends on the hardware implementation.
- Quality of the random value is very important for having a good security
- level on many cryptographic algorithms used inside TEE. It is recommended
- to have equivalent level of SP 800-90B and FIPS 140-3.
- 

### Returns

- returns random value \*/

```

void tee_random_get(void)
{
    unsigned char rbuf[16];
    TEE_GenerateRandom(rbuf, sizeof(rbuf));
    tee_printf("random: ");
    for (int i = 0; i < sizeof(rbuf); i++) {
        tee_printf("%02x", rbuf[i]);
    }
    tee_printf("\n");
}

```

## 5.3 Hash Functions

/\*\*

- message\_digest\_gen() - Example program to show how to use hash functions
- with ta-ref API.
- 
- Calculate hash value of a data in SHA256 and store it.
- Check the return value of each API call on real product development. \*/

```

void message_digest_gen(void)
{

```

```

uint8_t data[DATA_SIZE] = {
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};
size_t hashlen = SHA_LENGTH;
uint8_t hash[SHA_LENGTH];
uint8_t *pdata = data;
TEE_OperationHandle handle;
TEE_Result rv;
TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
TEE_DigestUpdate(handle, pdata, CHUNK_SIZE);
pdata += CHUNK_SIZE;
TEE_DigestDoFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, hash, &hashlen);
TEE_FreeOperation(handle);
tee_printf("hash: ");
for (int i = 0; i < hashlen; i++) {
    tee_printf ("%02x ", hash[i]);
}
tee_printf("\n");
secure_storage_write(hash, hashlen, "hash_value");
}

```

/\*\*

- message\_digest\_check() - Example program to show how to use hash
- functions with ta-ref API.
- 
- Checking the hash value is the easiest way to confirm the integrity of
- the data. Calculate hash value of a data and compare it with the saved
- hash value to verify whether the data is the same as the previous data.
- Check the return value of each API call on real product development.
- 

#### Returns

- 0 on data match, others if not \*/

```

int message_digest_check(void)
{
    uint8_t data[DATA_SIZE] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
    };
    size_t hashlen = SHA_LENGTH;
    uint8_t hash[SHA_LENGTH];
    uint8_t saved_hash[SHA_LENGTH];
    uint8_t *pdata = data;
    TEE_OperationHandle handle;
    TEE_Result rv;
    int ret;
    TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
    TEE_DigestUpdate(handle, data, CHUNK_SIZE);
    pdata += CHUNK_SIZE;
    TEE_DigestDoFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, hash, &hashlen);
    TEE_FreeOperation(handle);
    tee_printf("hash: ");
    for (int i = 0; i < hashlen; i++) {
        tee_printf ("%02x ", hash[i]);
    }
    tee_printf("\n");
    secure_storage_read(saved_hash, &hashlen, "hash_value");
    ret = memcmp(saved_hash, hash, hashlen);
    if (ret == 0) {
        tee_printf("hash: matched!\n");
    }
    return ret;
}

```

## 5.4 Symmetric Crypto AES-GCM Functions

/\*\*

- Example program to show how to use AES 256 GCM functions with ta-ref API.
- 
- Generate a key and encrypt a data and stores it.
- Check the return value of each API call on real product development. \*/

```
void symmetric_key_enc(void)
{
    uint8_t data[DATA_SIZE] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f,
        0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17,
        0x18, 0x19, 0x1a, 0x1b, 0x1c, 0x1d, 0x1e, 0x1f
    };
    uint8_t out[ENCDATA_MAX];
    size_t outlen = ENCDATA_MAX;
    uint8_t iv[TAG_LEN];
    uint8_t tag[TAG_LEN];
    size_t taglen = TAG_LEN_BITS;
    uint8_t *pdata = data;
    size_t keylen = 256;
    TEE_OperationHandle handle;
    TEE_Result rv;
    TEE_AllocateTransientObject(TEE_TYPE_AES, 256, &key);
    TEE_GenerateKey(key, 256, NULL, 0);
    TEE_AllocateOperation(&handle, TEE_ALG_AES_GCM, TEE_MODE_ENCRYPT, 256);
    TEE_SetOperationKey(handle, key);
    // tee_printf("key: ");
    // for (int i = 0; i < 256 / 8; i++) {
    //     tee_printf ("%02x", key[i]);
    // }
    // tee_printf("\n");
    TEE_GenerateRandom(iv, sizeof(iv));
    TEE_AEInit(handle, iv, sizeof(iv), TAG_LEN_BITS, 0, 0);
    TEE_AEUpdateAAD(handle, pdata, CHUNK_SIZE);
    pdata += CHUNK_SIZE;
    /* Equivalent in openssl is EVP_EncryptFinal() */
    TEE_AEEncryptFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, out, &outlen, tag, &taglen);
    TEE_FreeOperation(handle);
    tee_printf("Encrypted Data: size:%d ", outlen);
    for (int i = 0; i < outlen; i++) {
        tee_printf ("%02x", out[i]);
    }
    tee_printf("\n");
    tee_printf("tag: size: %d ", taglen);
    for (int i = 0; i < taglen; i++) {
        tee_printf ("%02x", tag[i]);
    }
    tee_printf("\n");
    // secure_storage_write(key, keylen, "sym_key");
    secure_storage_write(out, outlen, "enc_data");
}
```

/\*\*

- Example program to show how to use AES 256 GCM functions with ta-ref API.
- 
- Retrive the key from secure store and decrypt the data.
- 

### Returns

- 0 on data match, others if not \*/

```

int symmetric_key_dec(void)
{
    uint8_t data[DATA_SIZE] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f,
        0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17,
        0x18, 0x19, 0x1a, 0x1b, 0x1c, 0x1d, 0x1e, 0x1f
    };
    size_t keylen = 256;
    uint8_t out[ENCDATA_MAX];
    size_t outlen = ENCDATA_MAX;
    uint8_t iv[TAG_LEN];
    uint8_t tag[TAG_LEN];
    size_t taglen = TAG_LEN_BITS;
    uint8_t *pdata = data;
    int ret;
    TEE_OperationHandle handle;
    TEE_Result rv;
    // secure_storage_read(key, &keylen, "sym_key");
    secure_storage_read(out, &outlen, "enc_data");
    tee_printf("Reading Stored Data: size:%d ", outlen);
    for (int i = 0; i < outlen; i++) {
        tee_printf ("%02x", out[i]);
    }
    tee_printf("\n");
    TEE_AllocateOperation(&handle, TEE_ALG_AES_GCM, TEE_MODE_DECRYPT, 256);
    TEE_SetOperationKey(handle, key);
    /* Equivalent of EVP_DecryptInit_ex() in openssl */
    TEE_AEInit(handle, iv, sizeof(iv), TAG_LEN_BITS, 0, 0);
    TEE_AEUpdateAAD(handle, pdata, CHUNK_SIZE);
    pdata += CHUNK_SIZE;
    /* Equivalent in openssl is EVP_EncryptFinal() */
    TEE_AEDecryptFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, out, &outlen, tag, &taglen);
    TEE_FreeOperation(handle);
    TEE_FreeTransientObject(key);
    tee_printf("Decrypted Data: ");
    for (int i = 0; i < outlen; i++) {
        tee_printf ("%02x", out[i]);
    }
    tee_printf("\n");
    tee_printf("Actual Data: ");
    for (int i = 0; i < outlen; i++) {
        tee_printf ("%02x", data[i]);
    }
    tee_printf("\n");
    ret = memcmp(data, out, outlen);
    if (ret == 0) {
        tee_printf("decrypt: Data matched!\n");
    } else {
        tee_printf("decrypt: Data does not match!\n");
    }
    return ret;
}

```

## 5.5 Asymmetric Crypto Functions

/\*\*

- Example program to show how to use asymmetric key encryption functions with ECDSA\_P256
- on ta-ref API.
- 
- Generate a keypair and creating signature of a data and stores them.
- Check the return value of each API call on real product development. \*/

```

void asymmetric_key_enc(void)
{
    tee_printf("Start of Aysmmetric Encryption\n");
    uint8_t data[DATA_SIZE] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f,
    };
}

```

```

        0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17,
        0x18, 0x19, 0x1a, 0x1b, 0x1c, 0x1d, 0x1e, 0x1f
    };
    uint8_t sig[SIG_LENGTH];
    size_t siglen = SIG_LENGTH;
    uint8_t *pdata = data;
    unsigned char hash[DATA_SIZE];
    uint32_t hashlen = DATA_SIZE;
    TEE_ObjectHandle keypair;
    TEE_OperationHandle handle;
    TEE_Attribute attr;
    TEE_Result rv;
    TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
    TEE_DigestUpdate(handle, pdata, CHUNK_SIZE);
    pdata += CHUNK_SIZE;
    TEE_DigestDoFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, hash, &hashlen);
    TEE_FreeOperation(handle);
    tee_printf("hash: size %d", hashlen);
    for (int i = 0; i < hashlen; i++) {
        tee_printf ("02x", hash[i]);
    }
    tee_printf("\n");
    TEE_AllocateTransientObject(TEE_TYPE_ECDSA_KEYPAIR, 256, &keypair);
    TEE_InitValueAttribute(&attr, TEE_ATTR_ECC_CURVE, TEE_ECC_CURVE_NIST_P256,
        256);
    TEE_GenerateKey(keypair, 256, &attr, 1);
    TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256, TEE_MODE_SIGN, 256);
    TEE_SetOperationKey(handle, keypair);
    TEE_AsymmetricSignDigest(handle, NULL, 0, hash, hashlen, sig, &siglen);
    TEE_FreeOperation(handle);
    tee_printf("Signature: size:%d ", siglen);
    for (int i = 0; i < siglen; i++) {
        tee_printf ("02x", sig[i]);
    }
    secure_storage_write(keypair, 256 / 8, "keypair");
    secure_storage_write(sig, siglen, "sig_data");
    tee_printf("End of Aysmmetric Encryption\n");
}

```

/\*\*

- Example program to show how to use asymmetric key Decryption functions with ECDSA\_P256
- on ta-ref API.

•

#### Returns

- 0 on successful decryption, others if not \*/

```

int asymmetric_key_dec(void)
{
    tee_printf("Start of Aysmmetric Decryption\n");

    uint8_t data[DATA_SIZE] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f,
        0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17,
        0x18, 0x19, 0x1a, 0x1b, 0x1c, 0x1d, 0x1e, 0x1f
    };
    uint8_t sig[TAG_LEN];
    size_t siglen = TAG_LEN_BITS;
    uint8_t *pdata = data;
    unsigned char hash[DATA_SIZE];
    uint32_t hashlen = DATA_SIZE;
    int ret;
    TEE_OperationHandle handle;
    TEE_ObjectHandle key;
    TEE_Result verify_ok;
    TEE_ObjectHandle keypair;
    // secure_storage_read(keypair, 256 / 8, "keypair");
    //secure_storage_read(sig, siglen, "sig_data");
    TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
    TEE_DigestUpdate(handle, pdata, CHUNK_SIZE);
    pdata += CHUNK_SIZE;
    TEE_DigestDoFinal(handle, pdata, DATA_SIZE - CHUNK_SIZE, hash, &hashlen);
    TEE_FreeOperation(handle);
    tee_printf("hash: size %d", hashlen);
    for (int i = 0; i < hashlen; i++) {

```

```

        tee_printf ("%02x", hash[i]);
    }
    tee_printf("\n");
    TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256, TEE_MODE_VERIFY, 256);
    TEE_SetOperationKey(handle, keypair);
    verify_ok = TEE_AsymmetricVerifyDigest(handle, NULL, 0, hash, hashlen, sig, siglen);
    TEE_FreeOperation(handle);
    // TEE_FreeTransientObject(keypair);
    if (verify_ok == TEE_SUCCESS) {
        tee_printf("verify ok\n");
        ret = 0;
    } else {
        tee_printf("verify fails\n");
        ret = -1;
    }
    tee_printf("End of Aysmmetric Decryption\n");
    return ret;
}

```

## 5.6 Open, Read, Write, Close On Secure Storage

/\*\*

- `secure_storage_write()` - Example program to show how to use secure
- storage with `ta-ref` API. Write the data to secure storage.
- 
- The secure storage is for storing cryptographic keys, certificates,
- security sensitive data such as personalization data. How the secure
- storage is secure is implementation dependent. Ideally the secure storage
- is provided separately from REE accessible areas and can not be tampered
- from User Application on REE, read, write, delete none retrievable the
- file name. Typically requires hardware support, and if not then some easy
- implementation might be just saving the data on a filesystem on Linux
- residing in REE which does not provide the secure level as mentioned here.
- The data are saved with different encryption keys from other TAs, and
- not able to read the same data by other TAs. \*/

```

void secure_storage_write(void)
{
    uint8_t data[DATA_SIZE] = {
        0xff, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
    };
    TEE_ObjectHandle object;
    TEE_CreatePersistentObject(TEE_STORAGE_PRIVATE,
                              "filename", strlen("filename"),
                              (TEE_DATA_FLAG_ACCESS_WRITE
                               | TEE_DATA_FLAG_OVERWRITE),
                              TEE_HANDLE_NULL,
                              NULL, 0,
                              &object);
    TEE_WriteObjectData(object, (const char *)data, DATA_SIZE);
    TEE_CloseObject(object);
}

```

/\*\*

- `secure_storage_read()` - Example program to show how to use secure
- storage with ta-ref API. Read the data from secure storage.
- 
- Read the data from the secure storage and compare with expected data.
- 

#### Returns

- `TEE_SUCCESS` if the data mached, others if not. \*/

```
int secure_storage_read(void)
{
    uint8_t cmp_data[DATA_SIZE] = {
        0xff, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
    };
    uint8_t buf[DATA_SIZE * 2];
    TEE_ObjectHandle object;
    TEE_OpenPersistentObject(TEE_STORAGE_PRIVATE,
                            "filename", strlen("filename"),
                            TEE_DATA_FLAG_ACCESS_READ,
                            &object);

    uint32_t count;
    TEE_ReadObjectData(object, (char *)buf, DATA_SIZE, &count);
    TEE_CloseObject(object);

## 6 Preparation and building ta-ref with docker

### 6.1 Preparation

For building ta-ref with docker, it is required to install docker on Ubuntu.

For the first time users of docker, please have a look on <https://docs.docker.com/engine/>

The following installation steps is for Ubuntu 20.04

#### 6.1.1 Installing Docker

```
$ sudo apt update

# Next, install a few prerequisite packages which let apt use packages over HTTPS:
$ sudo apt install apt-transport-https ca-certificates curl software-properties-common

# Then add the GPG key for the official Docker repository to your system:
$ curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -

# Add the Docker repository to APT sources:
$ sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu focal stable"

# This will also update our package database with the Docker packages from the newly added repo.
# Make sure you are about to install from the Docker repo instead of the default Ubuntu repo:
$ apt-cache policy docker-ce

#Finally, install Docker
$ sudo apt install docker-ce
```

#### 6.1.2 Executing Docker without sudo

By default, the docker command can only be run the root user or by a user in the docker group, which is automatically created during Docker's installation process. If you attempt to run the docker command without prefixing it with sudo or without being in the docker group, you'll get an output like this:

```
docker: Cannot connect to the Docker daemon. Is the docker daemon running on this host?.
```

To avoid typing sudo whenever we run the docker command, add your username to the docker group.

```
$ sudo groupadd docker
$ sudo gpasswd -a $USER docker
# Logout and then log-in again to apply the changes to the group
```

After you logout and login, you can probably run the docker command without `sudo`

```
$ docker run hello-world
```

### 6.1.3 Create a docker network tamproto

A docker network named tamproto is required when we run ta-ref for Keystone. The local network is required to connect with tamproto service running locally.

```
$ docker network create tamproto_default
```

## 6.2 Docker images details

The docker images with all necessary packages for building ta-ref for all three targets are already available. Make sure you have account on docker-hub. If not please create one on [dockerhub.com](https://www.dockerhub.com). The details are mentioned below

Target	docker image
Keystone	aistcpsec/tee-dev:keystone-1.↔ 0.0
OP-TEE	aistcpsec/tee-dev:optee-3.10.0
Intel SGX	aistcpsec/tee-dev:sgx-2.10

## 6.3 Building ta-ref with Docker

### 6.3.1 Building ta-ref for Keystone with docker

Following commands are to be executed on Ubuntu 20.04.

```
# Clone the ta-ref repo and checkout teep-master branch
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref/
$ git checkout teep-master

# Sync and update the submodules
$ git submodule sync --recursive
$ git submodule update --init --recursive

# Start the docker
$ docker run --network tamproto_default -it --rm -v $(pwd):/home/user/ta-ref
aistcpsec/tee-dev:keystone-1.0.0
```

After you start the docker command, you will be logged-in inside the docker container. Following are the commands to be executed inside the docker

```
# [Inside docker image]

$ cd ta-ref/
$ source env/keystone.sh
```

```
# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp
```

By the above steps, we have successfully built the ta-ref. Below we are going to push it into qemu and test its working

#### Test the built test\_hello, test\_gp binaries in Qemu

```
# Copy the test_hello inside qemu root
$ mkdir $KEYSTONE_DIR/build/overlay/root/test_hello
$ cp test_hello/keystone/App/App.client $KEYSTONE_DIR/build/overlay/root/test_hello/
$ cp test_hello/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/build/overlay/root/test_hello/
$ cp $KEYSTONE_SDK_DIR/runtime/eyrie-rt $KEYSTONE_DIR/build/overlay/root/test_hello/

# Copy the test_gp inside qemu root
$ mkdir $KEYSTONE_DIR/build/overlay/root/test_gp
$ cp test_gp/keystone/App/App.client $KEYSTONE_DIR/build/overlay/root/test_gp/
$ cp test_gp/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/build/overlay/root/test_gp/
$ cp $KEYSTONE_SDK_DIR/runtime/eyrie-rt $KEYSTONE_DIR/build/overlay/root/test_gp/

# Re-build the keystone again to copy test_hello and test_gp inside qemu
$ cd $KEYSTONE_DIR/build
$ make

# Start the Qemu console from $KEYSTONE_DIR/build dir
$ ./scripts/run-qemu.sh

# When asked for username and password use
# username : root
# password : sifive

# Inside Qemu run the steps to test test_hello and test_gp
# Load keystone driver
$ insmod keystone-driver.ko

# Test test_hello
# cd test_hello/
# ./App.client Enclave.eapp_riscv eyrie-rt

### 6.3.2 Building ta-ref for OP-TEE with docker

Following commands are to be executed on Ubuntu 20.04.

```
# Clone the ta-ref repo and checkout teep-master branch
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref/
$ git checkout teep-master

# Sync and update the submodules
$ git submodule sync --recursive
$ git submodule update --init --recursive

# Start the docker
$ docker run -it --rm -v $(pwd):/home/user/ta-ref aistcpsec/tee-dev:optee-3.10.0
```

After you start the docker command, you will be logged-in inside the docker container. Following are the commands to be executed inside the docker

```
# [Inside docker image]

$ cd ta-ref/
$ source env/optee_qemu.sh

# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp
```

By the above steps, we have successfully built the ta-ref. Below we are going to push it into qemu and test its working

#### Test the built test\_hello, test\_gp binaries in Qemu

```
# Extract the rootfs.cpio.gz into a directory
$ cd ${OPTEE_OUTBR_DIR}/images
$ rm -rf rootfs && mkdir rootfs && cd rootfs
$ gzip -dc ../rootfs.cpio.gz | sudo cpio -i

# Copy the test binaries into the extracted directory
# Create test directories inside root folder and copy the binaries - TEST_HELLO
$ export OPTEE_TEST_HELLO_DIR=${OPTEE_OUTBR_DIR}/images/rootfs/root/test_hello
$ sudo mkdir ${OPTEE_TEST_HELLO_DIR}
$ sudo cp ~/ta-ref/test_hello/optee/App/optee_ref_ta ${OPTEE_TEST_HELLO_DIR}
$ sudo cp ~/ta-ref/test_hello/optee/Enclave/a6f77cle-96fe-4a0e-9e74-262582a4c8f1.ta
  ${OPTEE_TEST_HELLO_DIR}

# Create test directories inside root folder and copy the binaries - TEST_GP
$ export OPTEE_TEST_GP_DIR=${OPTEE_OUTBR_DIR}/images/rootfs/root/test_gp
$ sudo mkdir ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/App/optee_ref_ta ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/Enclave/a6f77cle-96fe-4a0e-9e74-262582a4c8f1.ta
  ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/Enclave/Enclave.nm ${OPTEE_TEST_GP_DIR}

# Re-pack the rootfs folder into a cpio archive
$ cd ${OPTEE_OUTBR_DIR}/images/rootfs
$ sudo find . | sudo cpio -o -H newc 2> /dev/null | gzip -c9 > ../rootfs.cpio.gz

# Start the Qemu console from $OPTEE_DIR/build directory
$ ln -sf /home/user/optee/out-br/images/rootfs.cpio.gz /home/user/optee/out/bin
$ cd /home/user/optee/out/bin && \
  /home/user/optee/qemu/aarch64-softmmu/qemu-system-aarch64 \
  -nographic \
  -serial mon:stdio -serial file:serial1.log \
  -smp 2 \
  -machine virt,secure=on -cpu cortex-a57 \
  -d unimp -semihosting-config enable,target=native \
  -m 1057 \
  -bios bll.bin \
  -initrd rootfs.cpio.gz \
  -kernel Image -no-acpi \
  -append "console=ttyAMA0,38400 keep_bootcon root=/dev/vda2"
# If you face any error like
# qemu-system-aarch64: keep_bootcon: Could not open 'keep_bootcon': No such file or directory
# Just replace the double quotes in the last line with single quotes.
# When asked for builroot login, please enter root
# buildroot login: root

# Inside Qemu run the steps to test test_hello and test_gp
# Test test_hello
$ cd test_hello/
```

```
# Start the docker
$ docker run -it --rm -v $(pwd):/home/user/ta-ref aistcpsec/tee-dev:sgx-2.10
```

Commands to be executed inside docker:

```
$ cd ta-ref/

# Source SGX environment variables
$ source /opt/intel/sgxsdk/environment
$ source env/sgx_x64.sh

# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp
```

By the above steps, we have successfully built the ta-ref. Since we are building in SIM mode, We can execute in docker itself.

There are two files required to test\_hello 1) ./sgx\_app 2)enclave.signed.so copy the files into a directory and then execute the ./sgx\_app command

#### Test the built test\_hello, test\_gp binaries in Docker SIM mode

Make sure test\_hello is already built in SIM mode. [Inside /home/user directory]

Test\_hello:

```
$ cd
$ mkdir test_hello

# Copy the sgx_app for test_hello
$ cp ta-ref/test_hello/sgx/App/sgx_app test_hello/
# Copy the enclave
$ cp ta-ref/test_hello/sgx/Enclave/enclave.signed.so test_hello/

# Change to test_hello
$ cd test_hello/

# Run the program
$ ./sgx_app
# [trimmed output]
hello world!
Info: Enclave successfully returned.
```

Test\_gp:

Make sure test\_hello is already built in SIM mode. [Inside /home/user directory]

```
$ cd
$ mkdir test_gp

# Copy the sgx_app for test_gp
$ cp ta-ref/test_gp/sgx/App/sgx_app test_gp/
# Copy the enclave
$ cp ta-ref/test_gp/sgx/Enclave/enclave.signed.so test_gp/

# Change to test_gp
$ cd test_gp/

# Run the program
$ ./sgx_app
# [trimmed output]

## 7 Preparation before building ta-ref without Docker

All the preparation steps below are based on Ubuntu 20.04

### 7.1 Keystone(RISC-V Unleashed)

Keystone is an open-source TEE framework for RISC-V processors. For more details check,

- <http://docs.keystone-enclave.org/en/latest>

#### 7.1.1 Required Packages

Install the following packages for building ta-ref on Keystone

```

$ sudo apt-get update
# Following packages are required for Keystone
$ sudo apt-get install -y autoconf automake autotools-dev bc bison \
  build-essential curl expat libexpat1-dev flex gawk gcc git gperf libgmp-dev \
  libmpc-dev libmpfr-dev libtool texinfo tmux patchutils zlib1g-dev wget \
  bzip2 patch vim-common lbzip2 python pkg-config libglib2.0-dev libpixmap-1-dev \
  libssl-dev screen device-tree-compiler expect make self unzip cpio rsync cmake \
  p7zip-full
# Following packages are required for clang, keyedge and make run commands in ta-ref.
$ sudo apt-get install -y clang-tools-6.0 libclang-6.0-dev cmake \
  ocaml expect screen sshpass

```

#### 7.1.2 Download RISC-V toolchain and Keystone SDK

Download the keystone sources

```

$ git clone https://github.com/keystone-enclave/keystone.git -b v1.0.0
$ cd keystone
$ ./fast-setup.sh
$ source ./source.sh

```

After executing the `./fast-setup.sh`, the toolchain for RISC-V has been installed at `keystone/riscv/bin` and it adds to your `PATH`.

Make the following changes to increase the max edge calls

```
sed -i 's/MAX_EDGE_CALL 10$/MAX_EDGE_CALL 1000/' <keystone_dir>/sdk/include/edge/edge_common.h
```

### Build the Keystone SDK

Make sure you are in keystone directory.

```
$ cd sdk/  
$ mkdir -p build  
$ cd build  
$ cmake .. $SDK_FLAGS  
$ make  
$ make install
```

### Build the Qemu Image

Make sure you are in keystone directory.

```
$ mkdir -p build  
$ cd build  
$ cmake ..  
$ make  
$ make image
```

### Launch the QEMU image

Make sure you are in keystone\build directory.

```
$ ./scripts/run-qemu.sh  
Welcome to Buildroot
```

Login to console with the following credentials

buildroot login = root, Password = sifive

```
buildroot login: root  
Password:  
$
```

Poweroff the console incase, if you want to exit.

```
$ poweroff
```

You can also use CTRL^A + X to exit Qemu Console.

## 7.1.3 Run Keystone examples

Run the following commands to generate hello world example programs to be executed on qemu.

Make sure you are in keystone\build directory.

```
$ make hello-package  
$ cp -r examples/hello ./overlay/root/  
# Update the image  
$ make image
```

### Launch QEMU console

```
$ ./scripts/run-gemu.sh
Welcome to Buildroot
```

Login to console with user=root, passwd=sifive

```
buildroot login: root
Password:
$
```

Run hello example

```
$ insmod keystone-driver.ko
[ 365.354299] keystone_driver: loading out-of-tree module taints kernel.
[ 365.364279] keystone_enclave: keystone enclave v0.2
$ ./hello/hello.ke
Verifying archive integrity... 100% All good.
Uncompressing Keystone vault archive 100%
hello, world!
```

You can also run the tests by executing `./tests.ke`

Poweroff the console incase, if you want to exit.

```
$ poweroff
```

## 7.2 OP-TEE (ARM64 Raspberry Pi 3 Model B)

OP-TEE is a Trusted Execution Environment (TEE) designed as companion to a non-secure Linux kernel running on Arm. Lets build OP-TEE for QEMU and Raspberry Pi3 Model B development board. For more details check,

- <https://optee.readthedocs.io/en/latest/>

### 7.2.1 Required Packages

Install the following packages

```
$ sudo dpkg --add-architecture i386
$ sudo apt-get update -y
$ sudo apt-get install -y android-tools-adb android-tools-fastboot autoconf \
automake bc bison build-essential ccache cscope curl device-tree-compiler \
expect flex ftp-upload gdisk iasl libattr1-dev libc6:i386 libcap-dev \
libbfd-dev libftdi-dev libglib2.0-dev libhidapi-dev libncurses5-dev \
libpixman-1-dev libssl-dev libstdc++6:i386 libtool libz1:i386 make \
mtools netcat python python-crypto python3-crypto python-pyelftools \
python3-pycryptodome python3-pyelftools python3-serial vim-common \
rsync unzip uuid-dev xdg-utils xterm xz-utils zlib1g-dev \
git python3-pip wget cpio texlive texinfo locales
```

Set the locale to English, to cope with the problem,  
<https://github.com/OP-TEE/build/issues/424#issuecomment-631302208>.

```
$ locale-gen en_US.UTF-8
$ export LANG=en_US.UTF-8
$ export LANGUAGE=en_US:en
$ export LC_ALL=en_US.UTF-8
```

### 7.2.2 Download and build OP-TEE Toolchains 3.10.0

Create the directory to build the OP-TEE toolchains and export the toolchain directory

```
$ mkdir -p /opt/arm-tc
$ export TOOLCHAIN_DIR=/opt/arm-tc
```

### Clone and build the OP-TEE toolchain

```
$ git clone https://github.com/OP-TEE/build.git -b 3.10.0
$ cd build
$ sudo make TOOLCHAIN_ROOT=${TOOLCHAIN_DIR} -f toolchain.mk -j2
$ export PATH=${TOOLCHAIN_DIR}/aarch64/bin:${TOOLCHAIN_DIR}/aarch32/bin:${PATH}
```

## 7.2.3 Download OP-TEE 3.10.0

### Install Androi repo to sync the OP-TEE repo

```
$ sudo git config --global user.name "dummy" && \
sudo git config --global user.email "dummy@gmail.com" && \
sudo git config --global color.ui false && \
mkdir ~/bin && \
curl https://storage.googleapis.com/git-repo-downloads/repo > ~/bin/repo && \
chmod a+x ~/bin/repo
$ export PATH=~/bin:${PATH}
```

### Get the source code for optee

```
$ mkdir optee && cd optee
$ export OPTEE_DIR=$(pwd)
$ repo init -u https://github.com/OP-TEE/manifest.git -m qemu_v8.xml -b 3.10.0
$ repo sync -j4 --no-clone-bundle
```

## 7.2.4 Build OP-TEE 3.10.0

```
$ cd ${OPTEE_DIR}/build
$ ln -s ${TOOLCHAIN_DIR} ${OPTEE_DIR}/toolchains
$ make TOOLCHAIN_ROOT=${TOOLCHAIN_DIR} -j`nproc`
```

### If build is successfull, the rootfs can be found as follows

```
$ ls -l ${OPTEE_DIR}/out-br/images/rootfs.cpio.gz
```

### 7.2.4.1 Clone and Build OP-TEE v3.9.0 for RPI3

#### Copy the following lines into "optee-rpi3.sh" script

```
#!/bin/bash -u
export OPTEE_VER=$1
export OPTEE_DIR=${PWD}/optee_${OPTEE_VER}_rpi3
mkdir ${OPTEE_DIR} || true
cd ${OPTEE_DIR}
~/bin/repo init -u https://github.com/knknkn1162/manifest.git -m rpi3.xml -b ${OPTEE_VER}
~/bin/repo sync -j4 --no-clone-bundle
ln -s ~/toolchains ${OPTEE_DIR}/. || true
echo 'CONFIG_CMDLINE="console=ttyAMA0,115200 kgdboc=ttyAMA0,115200 root=/dev/mmcblk0p2
rootfstype=ext4 noinitrd rw rootwait init=/lib/systemd/systemd"' > build/defconfig-cmdline.txt
cd build
make OPTEE_CLIENT_BIN_ARCH_EXCLUDE=/boot
LINUX_DEFCONFIG_COMMON_FILES=${OPTEE_DIR}/linux/arch/arm64/configs/bcmrpi3_defconfig
${OPTEE_DIR}/build/kconfigs/rpi3.conf ${OPTEE_DIR}/build/defconfig-cmdline.txt"
BR2_PACKAGE_OPTEE_OS_EXT=n BR2_PACKAGE_OPTEE_TEST_EXT=n
BR2_PACKAGE_OPTEE_EXAMPLES_EXT=n BR2_TOOLCHAIN_EXTERNAL_GCC_8=y BR2_TOOLCHAIN_EXTERNAL_HEADERS_4_19=y
BR2_HOST_GCC_AT_LEAST_8=y
BR2_TOOLCHAIN_HEADERS_AT_LEAST="4.19" -j`nproc`
```

### Run the script as follows

```
$ chmod +x optee-rpi3.sh
$ ./optee-rpi3.sh 3.9.0
```

If build is successful, the rootfs can be found as follows

```
$ ls -l ../out-br/images/rootfs.cpio.gz
```

## 7.2.5 Run OP-TEE Examples

### 7.2.5.1 Launching QEMU Console

Run following commands from OP-TEE build directory

```
$ cd $OPTEE_DIR/build
$ make run
```

Once above command is success, QEMU is ready

```
* QEMU is now waiting to start the execution
* Start execution with either a 'c' followed by <enter> in the QEMU console or
* attach a debugger and continue from there.
*
* To run OP-TEE tests, use the xtest command in the 'Normal World' terminal
* Enter 'xtest -h' for help.
cd /TEE/demo/rpi3/optee_3.9.0_qemu/build/./out/bin
&& /TEE/demo/rpi3/optee_3.9.0_qemu/build/./qemu/aarch64-softmmu/qemu-system-aarch64 \
-nographic \
-serial tcp:localhost:54320 -serial tcp:localhost:54321 \
-smp 2 \
-s -S -machine virt,secure=on -cpu cortex-a57 \
-d unimp -semihosting-config enable,target=native \
-m 1057 \
-bios bl1.bin \
-initrd rootfs.cpio.gz \
-kernel Image -no-acpi \
-append 'console=ttyAMA0,38400 keep_bootcon root=/dev/vda2' \
-object rng-random,filename=/dev/urandom,id=rng0 -device virtio-rng-pci,rng=rng0,max-bytes=1024,
period=1000 -netdev user,id=vmnic -device virtio-net-device,netdev=vmnic
QEMU 3.0.93 monitor - type 'help' for more information
(qemu) c
Now Optee started to boot from another tab on the Terminal
```

### 7.2.5.2 Run hello world example

Once boot completed it displays following message, then enter "root" to login to the shell

```
Welcome to Buildroot, type root or test to login
buildroot login: root
$
$ optee_example_hello_world
Invoking TA to increment 42
TA incremented value to 43
```

Poweroff the console in case, if you want to exit.

```
$ poweroff
```

## 7.3 SGX (Intel NUC)

Intel(R) Software Guard Extensions (Intel(R) SGX) is an Intel technology for application developers who is seeking to protect selected code and data from disclosure or modification. For more details check,

- <https://github.com/intel/linux-sgx/blob/master/README.md>

### 7.3.1 List of machines which are confirmed to work

1. Intel NUC7PJYH - Intel(R) Celeron(R) J4005 CPU @ 2.00GHz
2. Intel NUC7PJYH - Intel(R) Pentium(R) Silver J5005 CPU @ 1.50GHz
3. Intel NUC9VXQNX - Intel(R) Xeon(R) E-2286M CPU @ 2.40GHz (Partially working)

### 7.3.2 BIOS Versions which are failed or succeeded in IAS Test

1. BIOS Version JYGLKCPX.86A.0050.2019.0418.1441 - IAS Test was Failed
2. BIOS Version JYGLKCPX.86A.0053.2019.1015.1510 - IAS Test was Failed
3. BIOS Version JYGLKCPX.86A.0057.2020.1020.1637 - IAS Test was Success
4. BIOS Version QNCFLX70.0034.2019.1125.1424 - IAS Test was Failed
5. BIOS Version QNCFLX70.0059.2020.1130.2122 - IAS Test was Success

Update BIOS from:

- <https://downloadcenter.intel.com/download/29987/BIOS-Update-JYGLKCPX->
- <https://downloadcenter.intel.com/download/30069/BIOS-Update-QNCFLX70->

### 7.3.3 BIOS Settings

1. Make sure you are running with latest version BIOS
2. Make sure you enabled SGX support in BIOS
3. Make sure `Secure Boot` disabled in BIOS

Refer: <https://github.com/intel/sgx-software-enable/blob/master/README.md>

### 7.3.4 Required Packages

Install following packages on Ubuntu 18.04

```
$ sudo apt-get install build-essential ocaml ocamlbuild automake autoconf libtool wget python  
libssl-dev git cmake perl libssl-dev libcurl4-openssl-dev protobuf-compiler libprotobuf-dev  
debhelper cmake reprepro expect unzip sshpass
```

### 7.3.5 Build SGX

There are 3 components which need to be build for SGX

1. linux-sgx
2. linux-sgx-driver
3. sgx-ra-sample

#### 7.3.5.1 SGX SDK

Clone and build

```
$ git clone https://github.com/intel/linux-sgx.git -b sgx_2.10
$ cd linux-sgx
$ git checkout sgx_2.10
$ ./download_prebuilt.sh
$ sudo cp external/toolset/ubuntu18.04/{as,ld,ld.gold,objdump} /usr/local/bin/
$ make -j`nproc` sdk_install_pkg DEBUG=1
```

#### Install SGX SDK

```
$ sudo ./linux/installer/bin//sgx_linux_x64_sdk_${version}.bin
```

where \${version} is a string something similar to 2.10.100.2.

Answer the question with `no` and input the install dir as `/opt/intel`

#### Build and Install SGX PSW packages

See here: <https://github.com/intel/linux-sgx#install-the-intelr-sgx-psw>

```
$ source /opt/intel/sgxsdk/environment
$ make deb_psw_pkg DEBUG=1
$ rm ./linux/installer/deb/*/*sgx-dcap-pccs*.deb
$ sudo dpkg -i ./linux/installer/deb/*/*.deb
```

#### Install SGX PSW packages from Intel Repository

See here: <https://github.com/intel/linux-sgx#install-the-intelr-sgx-psw-1>

Using the local repo is recommended, since the system will resolve the dependencies automatically.

Check at page no.7, [https://download.01.org/intel-sgx/sgx-linux/2.9/docs/Intel\\_SGX\\_Installation\\_Guide\\_Linux\\_2.9\\_Open\\_Source.pdf](https://download.01.org/intel-sgx/sgx-linux/2.9/docs/Intel_SGX_Installation_Guide_Linux_2.9_Open_Source.pdf)

```
$ sudo apt install libsgx-enclave-common libsgx-epid libsgx-launch libsgx-urts libsgx-uae-service
libsgx-quote-ex
```

If you see below error,

```
Errors were encountered while processing:
/tmp/apt-dpkg-install-pCB0cR/04-libsgx-headers_2.12.100.3-bionic1_amd64.deb
```

Here is the fix

```
$ sudo apt -o Dpkg::Options::="--force-overwrite" --fix-broken install
```

#### 7.3.5.2 Build and Install SGX Driver

See [linux-sgx-driver](#).

Caveat: Whenever updating kernel, don't forget rebuilding this driver with new version of the kernel header. (There are a few linux-sgx-driver-dkms repo, though I've experienced troubles with them.)

Clone and build

```
$ git clone https://github.com/intel/linux-sgx-driver.git
$ cd linux-sgx-driver
$ make
```

Install SGX driver

```
$ sudo mkdir -p "/lib/modules/"`uname -r`"/kernel/drivers/intel/sgx"
$ sudo cp isgx.ko "/lib/modules/"`uname -r`"/kernel/drivers/intel/sgx"
$ sudo sh -c "cat /etc/modules | grep -Fxq isgx || echo isgx » /etc/modules"
$ sudo /sbin/depmod
$ sudo /sbin/modprobe isgx
```

When modprobe fails with "Operation is not permitted", disable secure boot in BIOS. So that the unsigned kernel driver can be installed. If it is success, reboot your machine and verify `sudo lsmod | grep isgx` if it shows `isgx.ko`

### 7.3.6 Run sgx-ra-sample

#### 7.3.6.1 Build sgx-ra-sample Clone and build OpenSSL 1.1.c

```
$ wget https://www.openssl.org/source/openssl-1.1.1c.tar.gz
$ tar xf openssl-1.1.1c.tar.gz
$ cd openssl-1.1.1c/
$ ./config --prefix=/opt/openssl/1.1.1c --openssldir=/opt/openssl/1.1.1c
$ make
$ sudo make install
$ cd ..
```

Clone and build sgx-ra-sample

```
$ git clone https://github.com/intel/sgx-ra-sample.git
$ cd sgx-ra-sample/
$ ./bootstrap
$ ./configure --with-openssldir=/opt/openssl/1.1.1c
$ make
```

#### 7.3.6.2 Prepare for IAS Test

1. Obtain a subscription key for the Intel SGX Attestation Service Utilizing Enhanced Privacy ID (EPID). See here: <https://api.portal.trustedservices.intel.com/EPID-attestation>
2. Download `Intel_SGX_Attestation_RootCA.pem` form above portal.
3. Edit `settings` file and update the file with your own values obtained from portal.

```
@@ -15,14 +15,14 @@ QUERY_IAS_PRODUCTION=0

```

### 7.3.6.4 Possible wget Error

Server may invoke wget command to get some files from intel servers. If the server side fails with following error

```

Connecting to api.trustedservices.intel.com (api.trustedservices.intel.com)|40.87.90.88|:443...
connected.
ERROR: cannot verify api.trustedservices.intel.com's certificate, issued by 'CN=COMODO RSA
Organization Validation Secure Server CA,O=COMODO CA Limited,L=Salford,ST=Greater
Manchester,C=GB':
Unable to locally verify the issuer's authority.
To connect to api.trustedservices.intel.com insecurely, use '--no-check-certificate'.

```

then add a line `ca-certificate = /etc/ssl/certs/ca-certificates.crt` to `/etc/wgetrc` file as super user, then test again.

### 7.3.6.5 BIOS Updating

If BIOS version is outdated, IAS may not succeed. So when you are done with BIOS update, the sgx driver would be required to make and install again.

Update BIOS from:

- <https://downloadcenter.intel.com/download/29987/BIOS-Update-JYGLKCPX->
- <https://downloadcenter.intel.com/download/30069/BIOS-Update-QNCFLX70->

### 7.3.6.6 Run LocalAttestation

Running SDK code samples in simulation mode

```

$ source /opt/intel/sgxsdk/environment
$ cd linux-sgx/SampleCode/LocalAttestation
$ make SGX_MODE=SIM
$ cd bin
$ ./app
succeed to load enclaves.
succeed to establish secure channel.
Succeed to exchange secure message...
Succeed to close Session...

```

Running in hardware mode (It works when you have latest BIOS and SGX support is enabled in BIOS)

```

$ source /opt/intel/sgxsdk/environment
$ cd linux-sgx/SampleCode/LocalAttestation
$ make SGX_MODE=HW
$ cd bin
$ ./app
succeed to load enclaves.
succeed to establish secure channel.
Succeed to exchange secure message...
Succeed to close Session...

```

## 7.4 Doxygen

This PDF (ta-ref.pdf) was generated using Doxygen version 1.9.2. To install doxygen-1.9.2 following procedure is necessary.

### 7.4.1 Required Packages

Install following packages on Ubuntu. Its better to install from package rather than using apt-install.

```
$ sudo apt install doxygen-latex graphviz texlive-full texlive-latex-base latex-cjk-all
```

Above packages required to generate PDF using doxygen.

### 7.4.2 Build and Install Doxygen

```
$ git clone https://github.com/doxygen/doxygen.git
$ cd doxygen
$ mkdir build
$ cd build
$ cmake -G "Unix Makefiles" ..
$ make
$ sudo make install
```

## 7.5 Customizing MbedTLS Configuration file

MbedTLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. MbedTLS has a configuration file `config.h` where we can select platform-specific settings, customize the features that will be build, select the modules and its configurations.

In our case, we customize mbedtls config file to add/remove crypto algorithms when building the mbedtls. The mbedtls default config supports many crypto algorithms which might be unnecessary and also increases the built binary size.

It is advisable to reduce the size of the binaries, by selecting only the required crypto algorithms for the embedded systems.

### 7.5.1 What can be customized?

1. how many hash algorithms to be supported  
For ex: md5, sha1, sha256, sha3 or etc
2. how many symmetric algorithms to be supported  
For ex: des, aes-cbc, aes-gcm or etc
3. how many asymmetric algorithms to be supported  
For ex: dsa, rsa, ecdsa, eddsa or etc and their key length

### 7.5.2 mbedtls configuration file (config.h)

The mbedtls official way is customizing config file is by editing the `include/mbedtls/config.h` file. But in optee's build system, it require modifying `optee_os/lib/libmbedtls/include/mbedtls_config_kernel.h`

Below are the different environments mbedtls config file locations, reference file and sample config.h configurations.

### 7.5.2.1 Optee mbedtls config file

Location of the config file in optee environment

optee/mbedtls/include/mbedtls/config.h

Have a look at the source which uses config.h file for reference.

Example source:

optee/mbedtls/include/mbedtls/library/ssl\_ciphersuites.c

Some sample configurations can be found in `configs/` directory. In Optee, the contents of configs directory is listed below.

```
$ ls -l optee/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 17 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 17 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 17 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 17 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 17 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 17 2021 README.txt
```

### 7.5.2.2 ta-ref mbedtls config file

Location of the config file in ta-ref environment

ta-ref/teep-device/libteep/mbedtls/include/mbedtls/config.h

Have a look at the source which uses config.h file for reference.

Example source:

ta-ref/teep-device/libteep/mbedtls/include/mbedtls/library/ssl\_ciphersuites.c

Some sample configurations can be found in `configs/` directory. In ta-ref, the contents of configs directory is listed below.

```
$ ls -l ta-ref/teep-device/libteep/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 18 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 18 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 18 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 18 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 18 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 18 2021 README.txt
```

### 7.5.2.3 teep-device mbedtls config file

Location of the config file in teep-device environment

teep-device/libteep/mbedtls/include/mbedtls/config.h

Have a look at the source which uses config.h file for reference.

Example source:

teep-device/libteep/mbedtls/include/mbedtls/library/ssl\_ciphersuites.c

Some sample configurations can be found in `configs/` directory. In teep-device, the contents of configs directory is listed below.

```
$ ls -l teep-device/libteep/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 18 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 18 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 18 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 18 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 18 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 18 2021 README.txt
```

### 7.5.3 Supplement Investigation information

It is necessary to edit the following file to select the cryptographic algorithm when using mbedtls in optee.

In optee, AES-GCM is not included by default. So we need to modify the mbedtls config file to enable AES-GCM algorithm. Below is the path of the file in optee kernel where we will select the crypto algorithms.

optee/optee\_os/lib/libmbedtls/include/mbedtls\_config\_kernel.h

Below is the path of file in TA SDK where we will select the crypto algorithms. In TA sdk, the AES-GCM is enabled by default. So any TA which uses AES-GCM should build successfully without any modification to the mbedtls config file.

optee/optee\_os/lib/libmbedtls/include/mbedtls\_config\_uta.h

## 8 Building ta-ref without Docker

### 8.1 ta-ref with Keystone

Make sure Keystone and other dependant sources have been built

#### 8.1.1 Cloning source and building

Install required packages

```
$ sudo apt-get update
$ sudo apt-get install -y clang-tools-6.0 libclang-6.0-dev cmake ocaml expect screen sshpass
```

Setup Env

```
$ export KEYSTONE_DIR=<path to your keystone directory>
$ export PATH=$PATH:$KEYSTONE_DIR/riscv/bin
```

Clone and Build KEYEDGE

```
$ GIT_SSL_NO_VERIFY=1 git clone --recursive https://192.168.100.100/rinkai/keyedge.git
$ cd keyedge
$ git checkout f9406aba2117147cc54462ede4766e26f028ced9
$ make
```

Clone and Build KEEDGER8R

```
$ GIT_SSL_NO_VERIFY=1 git clone --recursive https://192.168.100.100/rinkai/keedger8r.git
$ cd keedger8r
$ make
```

```
$ sed -i 's/MAX_EDGE_CALL 10$/MAX_EDGE_CALL 1000/' ${KEYSTONE_DIR}/sdk/lib/edge/include/edge_common.h
$ make -C ${KEYSTONE_DIR}/sdk/lib clean all
```

### Clone the source

```
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-device-tb-slim
$ git submodule sync --recursive
git submodule update --init --recursive
```

### Build

```
$ export KEYSTONE_DIR=<path to keystone directory>
$ export KEYSTONE_SDK_DIR=$KEYSTONE_DIR/sdk
$ export KEYEDGE_DIR=<path to keyedge directory>
$ export KEEDGER8R_DIR=<path to keedger8r directory>
$ source env/keystone.sh
$ make build test-bin MACHINE=HIFIVE TEST_DIR=test_hello
$ make build test-bin MACHINE=HIFIVE TEST_DIR=test_gp
```

## 8.1.2 Check ta-ref by running test\_gp, test\_hello, on QEMU

Copy the test\_hello and test\_gp programs to QEMU.

### 8.1.2.1 Launch QEMU Console

```
$ cd $KEYSTONE_DIR
$ ./scripts/run-qemu.sh
Welcome to Buildroot
```

#### 8.1.2.2 test\_hello

Run test\_hello

```
$ cp test_hello/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/buildroot_overlay/root/test_hello/
$ cp test_hello/keystone/Enclave/App.client $KEYSTONE_DIR/buildroot_overlay/root/test_hello/
$ cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt $KEYSTONE_DIR/buildroot_overlay/root/test_hello/

$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt
hello world!
```

#### 8.1.2.3 test\_gp

Run test\_gp

```
$ cp test_gp/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ cp test_gp/keystone/Enclave/App.client $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ insmod keystone-driver.ko
$ ./App.client Enclave.eapp_riscv eyrie-rt

## 8.2 ta-ref with OP-TEE

Make sure optee\_3.9.0\_rpi3 has been built already.

### 8.2.1 Cloning source and building

Clone the source

```

$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-device-tb-slim
$ git submodule sync --recursive
$ git submodule update --init --recursive

```

Build

```

$ export OPTEE_DIR=<path to optee_3.9.0_rpi3>
$ source env/optee_rpi3.sh
$ make build test-bin MACHINE=RPI3 TEST_DIR=test_hello
$ make build test-bin MACHINE=RPI3 TEST_DIR=test_gp

```

### 8.2.2 Check ta-ref by running test\_gp, test\_hello, on QEMU

Copy the test\_hello and test\_gp programs to QEMU buildroot directory

```

$ mkdir -p optee_3.9.0_qemu/out-br/target/home/gitlab/out/{test_hello,test_gp}
$ cp ta-ref/test_hello/optee/App/optee_ref_ta optee_3.9.0_qemu/out-br/target/home/gitlab/out/test_hello/
$ cp ta-ref/test_hello/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  optee_3.9.0_qemu/out-br/target/home/gitlab/out/test_hello/
$ cp ta-ref/test_gp/optee/App/optee_ref_ta
  optee_3.9.0_qemu/out-br/target/home/gitlab/out/test_gp/
$ cp ta-ref/test_gp/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  optee_3.9.0_qemu/out-br/target/home/gitlab/out/test_gp/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ cp ./test_gp/optee/Enclave/Enclave.nm
  /TEE/demo/rpi3/optee_3.9.0_qemu/out-br/target/home/gitlab/out/test_gp/

```

#### 8.2.2.1 test\_hello

Run test\_hello

```

$ cd /home/gitlab/out/test_hello/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  /lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
--- enclave log start---
ecall_ta_main() start
hello world!
ecall_ta_main() end
--- enclave log end---

```

If executed successfully, you see above messages

### 8.2.2.2 test\_gp

Run test\_gp

```
$ cd /home/gitlab/out/test_gp/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  /lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
start TEEC_InvokeCommand
--- enclave log start---

## 8.3 ta-ref with SGX

Build ta-ref for Intel SGX platforms

### 8.3.1 Cloning source and building

Clone the source

```
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-device-tb-slim
```

```
$ git submodule sync --recursive
$ git submodule update --init --recursive
```

## Build

```
$ source /opt/intel/sgx/sdk/environment
$ source env/sgx_x64.sh
$ make build test-bin MACHINE=NUC TEST_DIR=test_hello
$ make build test-bin MACHINE=NUC TEST_DIR=test_gp
```

### 8.3.2 Check ta-ref by running test\_gp, test\_hello, simulation mode on any pc

Copy the ta-ref's test\_hello & test\_gp executables to test directory

#### 8.3.2.1 test\_hello

Run test\_hello

```
$ cp test_hello/sgx/Enclave/enclave.signed.so <test directory>
$ cp test_hello/sgx/App/sgx_app <test directory>
$ <test directory>/sgx_app
hello world!
Info: Enclave successfully returned.
```

#### 8.3.2.2 test\_gp

Run test\_gp

```
$ cp test_gp/sgx/Enclave/enclave.signed.so <test directory>
$ cp test_gp/sgx/App/sgx_app <test directory>
$ <test directory>/sgx_app

## 8.4 Generating ta-ref.pdf with Doxygen

As a pre-requisite, make sure doxygen-1.9.2 was installed and built already.

### 8.4.1 Cloning source and building docs

#### Clone the ta-ref source

```
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-master
```

#### Build the documentation

```
# Export TEE Variable, TEE can be set to anything
$ export TEE=keystone
# Build the docs
$ make docs
```

After running the `make docs`, the doxygen build will be started and generates the `ta-ref.pdf` inside `docs` folder.

## 9 Running on Development Boards

### 9.1 Keystone, Unleashed

Make sure Keystone and other dependant sources have been built

#### 9.1.1 Preparation of rootfs on SD Card

Build a modified `gdisk` which can handle the sifive specific partition types.

Prerequisites: `libncursesw5-dev`, `libpopt-dev`

```
$ cd ..
$ sudo apt install libncursesw5-dev lib64ncurses5-dev uuid-dev libpopt-dev build-essential
$ git clone https://192.168.100.100/rinkai/gptfdisk.git
$ cd gptfdisk
$ git checkout -b risc-v-sd 3d6a15873f582803aa8ad3288b3e32d3daff9fde
$ make
```

##### 9.1.1.1 Create SD-card partition manually

```
$ sudo ./gdisk /dev/mmcblk0
GPT fdisk (gdisk) version 1.0.4
Partition table scan:
  MBR: protective
  BSD: not present
  APM: not present
  GPT: present
Found valid GPT with protective MBR; using GPT.
Command (? for help): n
Partition number (1-128, default 1): 1

Command (? for help): wq
Final checks complete. About to write GPT data. THIS WILL OVERWRITE EXISTING
PARTITIONS!!
Do you want to proceed? (Y/N): y
OK; writing new GUID partition table (GPT) to /dev/mmcblk1.
Warning: The kernel is still using the old partition table.
The new table will be used at the next reboot or after you
run partprobe(8) or kpartx(8)
The operation has completed successfully.

```

### 9.1.1.2 Write boot and rootfs files into SD-card

#### Build FSBL for hifive-Unleashed board

```

$ git clone https://github.com/keystone-enclave/freedom-u540-c000-bootloader.git
$ cd freedom-u540-c000-bootloader
$ git checkout -b dev-unleashed bbfcc288fb438312af51adef420aa444a0833452
$ # Make sure riscv64 compiler set to PATH (export PATH=$KEYSTONE_DIR/riscv/bin:$PATH)
$ make

```

#### Writing fsbl.bin and bbl.bin

```

$ sudo dd if=freedom-u540-c000-bootloader/fsbl.bin of=/dev/mmcblk0p4 bs=4096 conv=fsync
$ sudo dd if=$KEYSTONE_DIR/hifive-work/bbl.bin of=/dev/mmcblk0p1 bs=4096 conv=fsync

```

Once files written, insert the SD-card into unleashed

### 9.1.2 Copying binaries of test\_hello and test\_gp

```

$ sudo mount /dev/mmcblk0p1 /media/rootfs/
$ sudo mkdir /media/rootfs/root/{test_hello,test_gp}

```

Copy test\_hello

```
$ sudo cp ta-ref/test_hello/keystone/Enclave/Enclave.eapp_riscv /media/rootfs/root/test_hello/
$ sudo cp ta-ref/test_hello/keystone/Enclave/App.client /media/rootfs/root/test_hello/
$ sudo cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt /media/rootfs/root/test_hello/
```

### Copy test\_gp

```
$ sudo cp ta-ref/test_gp/keystone/Enclave/Enclave.eapp_riscv /media/rootfs/root/test_gp/
$ sudo cp ta-ref/test_gp/keystone/Enclave/App.client /media/rootfs/root/test_gp/
$ sudo cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt /media/rootfs/root/test_gp/
```

Now, we are ready to test on unleashed board.

### 9.1.3 Check test\_hello and test\_gp on Unleased

1. Insert SD-card into unleashed board
2. Boot Hifive-Unleased board
3. Connect Unleased board with your development machine over USB-Serial cable (/dev/ttyUSB1)
4. Checking on Unleased  
Login to serial console with user=root, passwd=sifive

```
buildroot login: root
Password:
$
```

#### test\_hello:

```
$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt
hello world!
```

#### test\_gp:

```
$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt

```

Test is successful.

## 9.2 OP-TEE, RPI3

Make sure OP-TEE v3.9.0 and other dependant sources have been built

### 9.2.1 Preparation of rootfs on SD Card

Use following examples to create partitions of boot and roots on SD-card

```

$ make img-help
$ fdisk /dev/sdx    # where sdx is the name of your sd-card
> p                # prints partition table
> d                # repeat until all partitions are deleted
> n                # create a new partition
> p                # create primary
> 1                # make it the first partition
> <enter>           # use the default sector
> +32M             # create a boot partition with 32MB of space
> n                # create rootfs partition
> p
> 2
> <enter>
> <enter>          # fill the remaining disk, adjust size to fit your needs
> t                # change partition type
> 1                # select first partition
> e                # use type 'e' (FAT16)
> a                # make partition bootable
> 1                # select first partition
> p                # double check everything looks right
> w                # write partition table to disk.

```

Usually your SD-card detected as `/dev/mmcblk0`. After partition it looks like below BOOT partition = `/dev/mmcblk0p1` rootfs partition = `/dev/mmcblk0p2`

#### Write boot file

```

$ mkfs.vfat -F16 -n BOOT /dev/mmcblk0p1
$ mkdir -p /media/boot
$ sudo mount /dev/mmcblk0p1 /media/boot
$ cd /media
$ gunzip -cd optee_3.9.0_rpi3/out-br/images/rootfs.cpio.gz | sudo cpio -idmv "boot/*"
$ umount boot

```

#### Write rootfs

```

$ mkfs.ext4 -L rootfs /dev/mmcblk0p2
$ mkdir -p /media/rootfs
$ sudo mount /dev/mmcblk0p2 /media/rootfs
$ cd rootfs
$ gunzip -cd <your-base-dir>/optee_3.9.0_rpi3/build/./out-br/images/rootfs.cpio.gz | sudo cpio
-idmv
$ rm -rf /media/rootfs/boot/*
$ cd .. && sudo umount rootfs

```

If you use CI from AIST, download `rpi3_sdimage` as follows

```

$ wget http://192.168.100.100:2000/optee_rpi3_sdimage.tar.xz
$ tar xf optee_rpi3_sdimage.tar.xz
$ dd if=rpi3_sdimage.bin of=/dev/mmcblk0p2 conv=fsync bs=4096

```

Now SD-card is ready to boot RPI3.

## 9.2.2 Copying binaries of `test_hello` and `test_gp` to rootfs partition

### Copying `test_hello` & `test_gp`

```

$ sudo mount /dev/mmcblk0p2 /media/rootfs
$ sudo mkdir -p /media/rootfs/home/gitlab/out/{test_hello,test_gp}
$ sudo cp ta-ref/test_hello/optee/App/optee_ref.ta /media/rootfs/home/gitlab/out/test_hello/
$ sudo cp ta-ref/test_hello/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/media/rootfs/home/gitlab/out/test_hello/
$ sudo cp ta-ref/test_gp/optee/App/optee_ref.ta /media/rootfs/home/gitlab/out/test_gp/
$ sudo cp ta-ref/test_gp/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/media/rootfs/home/gitlab/out/test_gp/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ sudo cp ta-ref/test_gp/optee/Enclave/Enclave.nm /media/rootfs/home/gitlab/out/test_gp/

```

### 9.2.3 Check test\_hello and test\_gp

1. Insert SD-card into RPI3 board, then power-on
2. Connect RPI3 board Serial console to your laptop (/dev/ttyUSB0 over minicom)
3. Checking on RPI3

Login to Serial console and enter "root" as username

```
buildroot login: root
Password:
$
```

test\_hello:

```
$ cp /home/gitlab/out/test_hello/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  /lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
--- enclave log start---
ecall_ta_main() start
hello world!
ecall_ta_main() end
--- enclave log end---
```

If executed successfully, you see above messages

test\_gp:

```
$ cd /home/gitlab/out/test_gp/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
  /lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
start TEEC_InvokeCommand

```

If executed successfully, you see above messages

## 9.3 SGX, NUC

Make sure SGX SDK, sgx driver and other dependant sources have been built and installed on NUC machine

### 9.3.1 Copying binaries of test\_hello and test\_gp to NUC machine

Login to NUC machine over SSH (Assuming that SSH enabled on NIC machine). Assuming that ta-ref was natively built on NUC machine at ~/ta-ref

```

$ ssh <ssh-user>@<IP-Address> 'mkdir -p ~/test_hello,test_gp'
$ scp ta-ref/test_hello/sgx/Enclave/enclave.signed.so <ssh-user>@<IP-Address>:~/test_hello
$ scp ta-ref/test_hello/sgx/App/sgx_app <ssh-user>@<IP-Address>:~/test_hello
$ scp ta-ref/test_gp/sgx/Enclave/enclave.signed.so <ssh-user>@<IP-Address>:~/test_gp
$ scp ta-ref/test_gp/sgx/App/sgx_app <ssh-user>@<IP-Address>:~/test_gp

```

Now can login to NUC machine for further testing.

### 9.3.2 Check test\_hello and test\_gp

Checking test\_hello

```

$ cd ~/test_hello
$ ./sgx_app
hello world!
Info: Enclave successfully returned.

```

Checking test\_gp

```

$ cd ~/test_gp
$ ./sgx_app
