

Trusted Application Programming Reference on Portable TEE

The National Institute of Advanced Industrial Science and Technology

2022-01-25

1 Overview of TA-Ref	1
1.1 Features of TA-Ref	1
1.1.1 Hardware Features of TA-Ref on TEE	1
1.2 Components of TA-Ref	2
1.2.1 TA-Ref Components on Keystone	2
1.2.2 TA-Ref Components on OP-TEE	2
1.2.3 TA-Ref Components on SGX	3
1.3 What we did on RISC-V	3
1.3.1 Challenges faced during Implementation	3
1.3.2 Selected GP TEE Internal API's for testing	4
1.4 Diagram	4
1.4.1 Dependency of category	4
2 API comparison with full set of GP API	5
2.1 GP API	5
3 How to run sample TA programs on ta-ref	7
3.1 Run samples for Keystone	7
3.2 Run samples for OP-TEE	8
3.3 Run samples for Intel SGX	9
4 How to write your first 'Hello World' TA Program	10
4.1 Step 1: Run the docker image	10
4.2 Step 2: Copy sample directory and modify	10
4.3 Step 3 : Modifications to Enclave.c	11
4.3.1 What to modify	11
4.4 Step 4 : Modifications to App-<target>.c	12
4.4.1 Modification to App-keystone.cpp	12
4.4.2 Modification to App-optee.cpp	12
4.4.3 Modification to App-sgx.cpp	13
4.5 Step 5 : Execute the Hello World TA	13
4.5.1 Execute the 'Hello World' TA for Keystone	13
4.5.2 Execute the 'Hello World' TA for OP-TEE	13
4.5.3 Execute the 'Hello World' TA for Intel SGX	14
5 AIST supported GP API's in TA's	14
5.1 Time Functions	14
5.2 Random Functions	15
5.3 Hash Functions	15
5.4 Symmetric Crypto Functions	16
5.5 Symmetric Crypto AES-GCM Functions	17
5.6 Asymmetric Crypto Functions	18
5.7 Open, Read, Write, Close On Secure Storage	20
5.8 API Error Codes and its values	21

6 Preparation and building ta-ref with docker	22
6.1 Preparation	22
6.1.1 Installing Docker	22
6.1.2 Executing Docker without sudo	22
6.1.3 Create a docker network tamproto	22
6.2 Docker images details	22
6.3 Building ta-ref with Docker	23
6.3.1 Building ta-ref for Keystone with docker	23
6.3.2 Building ta-ref for OP-TEE with docker	25
6.3.3 Building ta-ref for Intel SGX with docker	27
7 Preparation before building ta-ref without Docker	29
7.1 Keystone(RISC-V Unleashed)	29
7.1.1 Required Packages	29
7.1.2 Download RISC-V toolchain and Keystone SDK	30
7.1.3 Run Keystone examples	31
7.2 OP-TEE (ARM64 Raspberry Pi 3 Model B)	31
7.2.1 Required Packages	31
7.2.2 Download and build OP-TEE Toolchains 3.10.0	32
7.2.3 Download OP-TEE 3.10.0	32
7.2.4 Build OP-TEE 3.10.0	32
7.2.5 Run OP-TEE Examples	33
7.3 SGX (Intel NUC)	34
7.3.1 List of machines which are confirmed to work	34
7.3.2 BIOS Versions which are failed or succeeded in IAS Test	34
7.3.3 BIOS Settings	35
7.3.4 Required Packages	35
7.3.5 Build SGX	35
7.3.6 Run sgx-ra-sample	36
7.4 Doxygen	39
7.4.1 Required Packages	39
7.4.2 Build and Install Doxygen	39
7.5 Customizing MbedTLS Configuration file	39
7.5.1 What can be customized?	40
7.5.2 mbedtIs configuration file (config.h)	40
7.5.3 Supplement Investigation information	41
8 Building ta-ref without Docker	41
8.1 ta-ref with Keystone	41
8.1.1 Cloning source and building	41
8.1.2 Check ta-ref by running test_gp, test_hello, on QEMU	42
8.2 ta-ref with OP-TEE	44
8.2.1 Cloning source and building	44

8.2.2 Check ta-ref by running test_gp, test_hello, on QEMU	44
8.3 ta-ref with SGX	46
8.3.1 Cloning source and building	46
8.3.2 Check ta-ref by running test_gp, test_hello, simulation mode on any pc	46
8.4 Generating ta-ref.pdf with Doxygen	48
8.4.1 Cloning source and building docs	48
9 Running on Development Boards	48
9.1 Keystone, Unleashed	48
9.1.1 Preparation of rootfs on SD Card	48
9.1.2 Copying binaries of test_hello and test_gp	50
9.1.3 Check test_hello and test_gp on Unleashed	50
9.2 OP-TEE, RPI3	52
9.2.1 Preparation of rootfs on SD Card	52
9.2.2 Copying binaries of test_hello and test_gp to rootfs partition	53
9.2.3 Check test_hello and test_gp	53
9.3 SGX, NUC	54
9.3.1 Copying binaries of test_hello and test_gp to NUC machine	54
9.3.2 Check test_hello and test_gp	54
10 Class Index	56
10.1 Class List	56
11 File Index	57
11.1 File List	57
12 Class Documentation	59
12.1 __TEE_ObjectHandle Struct Reference	59
12.1.1 Member Data Documentation	59
12.2 __TEE_OperationHandle Struct Reference	60
12.2.1 Member Data Documentation	60

1 Overview of TA-Ref

1.1 Features of TA-Ref

- Provides Portable API and SDK among Intel SGX, ARM TrustZone-A and RISC-V Keystone
- Provides portability for source codes of Trusted Applications among SGX, TrustZone and Keystone
- Provides subset of Global Platform API

1.1.1 Hardware Features of TA-Ref on TEE

1.2 Components of TA-Ref

1.2.1 TA-Ref Components on Keystone

1.2.2 TA-Ref Components on OP-TEE

1.2.3 TA-Ref Components on SGX

1.3 What we did on RISC-V

- We designed the GP internal API library to be portable.
- Keystone SDK is utilized because of runtime "Eyrie".
- The library is ported to Intel SGX as well as RISC-V Keystone.

1.3.1 Challenges faced during Implementation

- The combination of GP internal API and cipher suite is big.
 - To reduce the size, We pick up some important GP internal APIs.
- Some APIs depend on CPU architecture.
 - We separate APIs into CPU architecture dependent / independent.
- Integrate GP TEE Internal API to Keystone SDK.
 - Keystone SDK includes EDL (Enclave Definition Language) named "keedger".
 - Keedger creates the code for OCALL (request from TEE to REE) to check the pointer and boundary.

1.3.2 Selected GP TEE Internal API's for testing

- CPU architecture dependent
 - Random Generator, Time, Secure Storage, Transient Object(TEE_GenerateKey)
- CPU architecture independent(Crypto)
 - Transient Object(exclude TEE_GenerateKey), Crypto Common, Authenticated Encryption, Symmetric/Asymmetric Cipher, Message Digest

Following shows the table of CPU Dependent and Independent API's with its functions.

Category	CPU (In)Dependent	Functions
Random Number	Dependent	TEE_GenerateRandom
Time	Dependent	TEE_GetREETime, TEE_GetSystemTime
Secure Storage	Dependent	TEE_CreatePersistentObject, TEE_OpenPersistentObject, TEE_ReadObjectData, TEE_WriteObjectData, TEE_CloseObject
Transient Object	Dependent Independent	TEE_GenerateKey, TEE_AllocateTransientObject, TEE_FreeTransientObject, TEE_InitRefAttribute, TEE_InitValueAttribute, TEE_SetOperationKey
Crypto Common	Independent	TEE_AllocateOperation, TEE_FreeOperation
Authenticated Encryption	Independent	TEE_AEInit, TEE_AEUpdateAAD, TEE_AEUpdate, TEE_AEEncryptFinal, TEE_AEDecryptFinal
Symmetric Cipher	Independent	TEE_CipherInit, TEE_CipherUpdate, TEE_CipherDoFinal
Asymmetric Cipher	Independent	TEE_AsymmetricSignDigest, TEE_AsymmetricVerifyDigest
Message Digest	Independent	TEE_DigestUpdate, TEE_DigestDoFinal

1.4 Diagram

1.4.1 Dependency of category

Dependency of category

- Some categories have dependency.
 - Crypto Common
 - Cipher suite must be registered before use.
 - Transient Object
 - The space for a key must be prepared before use.

Sample Program

```
// Allocate a transient object for keypair
TEE_AllocateTransientObject(TEE_TYPE_ECDSA_KEYPAIR,
KEY_SIZE, &keypair);
// Assemble an attribute for ecc key
TEE_InitValueAttribute(&attr, TEE_ATTR_ECC_CURVE,
TEE_ECC_CURVE_NIST_P256, KEY_SIZE);
// Generate a keypair having that attribute
TEE_GenerateKey(keypair, KEY_SIZE, &attr, 1);
```

```
// Allocate sign operation
TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256,
TEE_MODE_SIGN, KEY_SIZE);
```

```
// Set the generated key to the sign operation
TEE_SetOperationKey(handle, keypair);
```

```
// Sign
uint32_t siglen = SIG_LENGTH;
TEE_AsymmetricSignDigest(handle, NULL, 0, hash,
hashlen, sig, &siglen);
```

```
// Free handle for the sign operation
TEE_FreeOperation(handle);
```

 Crypto Common
 Transient Object
 Asymmetric (Sign/Verify)

2 API comparison with full set of GP API

2.1 GP API

API Functions by Category

APIs supported by both GP and AIST-GP are in Blue

API list from TEE Internal Core API Specification documentation, GlobalPlatform Technology

Asymmetric	TEE_FreeOperation
TEE_AsymmetricDecrypt	TEE_GetOperationInfo
TEE_AsymmetricEncrypt	TEE_GetOperationInfoMultiple
TEE_AsymmetricSignDigest	TEE_IsAlgorithmSupported
TEE_AsymmetricVerifyDigest	TEE_ResetOperation
Authenticated Encryption	TEE_SetOperationKey
TEE_AEDecryptFinal	TEE_SetOperationKey2
TEE_AEEncryptFinal	Initialization
TEE_AEInit	TEE_BigIntInit
TEE_AEUpdate	TEE_BigIntInitFMM
TEE_AEUpdateAAD	TEE_BigIntInitFMMContext
Basic Arithmetic	Internal Client API
TEE_BigIntAdd	TEE_CloseTASession
TEE_BigIntDiv	TEE_InvokeTACommand
TEE_BigIntMul	TEE_OpenTASession
TEE_BigIntNeg	Key Derivation
TEE_BigIntSquare	TEE_DeriveKey
TEE_BigIntSub	Logical Operation
Cancellation	TEE_BigIntCmp
TEE_GetCancellationFlag	TEE_BigIntCmpS32
TEE_MaskCancellation	TEE_BigIntGetBit
TEE_UnmaskCancellation	TEE_BigIntGetBitCount
Converter	TEE_BigIntShiftRight
TEE_BigIntConvertFromOctetString	MAC
TEE_BigIntConvertFromS32	TEE_MACCompareFinal
TEE_BigIntConvertToOctetString	TEE_MACComputeFinal
TEE_BigIntConvertToS32	TEE_MACInit
Data Stream Access	TEE_MACUpdate
TEE_ReadObjectData	Memory Allocation and Size of Objects
TEE_SeekObjectData	TEE_BigIntFMMContextSizeInU32
TEE_TruncateObjectData	TEE_BigIntFMMSizeInU32
TEE_WriteObjectData	TEE_BigIntSizeInU32 (macro)
Deprecated	Memory Management
TEE_CloseAndDeletePersistentObject	TEE_CheckMemoryAccessRights
TEE_CopyObjectAttributes	TEE_Free
TEE_GetObjectInfo	TEE_GetInstanceData
TEE_RestrictObjectUsage	TEE_Malloc
Fast Modular Multiplication	TEE_MemCompare
TEE_BigIntComputeFMM	TEE_MemFill
TEE_BigIntConvertFromFMM	TEE_MemMove
TEE_BigIntConvertToFMM	TEE_Realloc
Generic Object	TEE_SetInstanceData
TEE_CloseObject	Message Digest
TEE_GetObjectBufferAttribute	TEE_DigestDoFinal
TEE_GetObjectInfo (deprecated)	TEE_DigestUpdate
TEE_GetObjectInfo1	Modular Arithmetic
TEE_GetObjectValueAttribute	TEE_BigIntAddMod
TEE_RestrictObjectUsage (deprecated)	TEE_BigIntInvMod
TEE_RestrictObjectUsage1	TEE_BigIntMod
Generic Operation	TEE_BigIntMulMod
TEE_AllocateOperation	TEE_BigIntSquareMod
TEE_CopyOperation	TEE_BigIntSubMod

Other Arithmetic

- TEE_BigIntComputeExtendedGcd
- TEE_BigIntIsProbablePrime
- TEE_BigIntRelativePrime

Panic Function

- TEE_Panic

Persistent Object

- TEE_CloseAndDeletePersistentObject
(deprecated)
- TEE_CloseAndDeletePersistentObject1
- TEE_CreatePersistentObject
- TEE_OpenPersistentObject
- TEE_RenamePersistentObject

Persistent Object Enumeration *

- TEE_AllocatePersistentObjectEnumerator
- TEE_FreePersistentObjectEnumerator
- TEE_GetNextPersistentObject
- TEE_ResetPersistentObjectEnumerator
- TEE_StartPersistentObjectEnumerator

Property Access

- TEE_AllocatePropertyEnumerator
- TEE_FreePropertyEnumerator
- TEE_GetNextProperty
- TEE_GetPropertyAsBinaryBlock
- TEE_GetPropertyAsBool
- TEE_GetPropertyAsIdentity
- TEE_GetPropertyAsString
- TEE_GetPropertyAsU32
- TEE_GetPropertyAsU64
- TEE_GetPropertyAsUUID
- TEE_GetPropertyName

- TEE_ResetPropertyEnumerator
- TEE_StartPropertyEnumerator

Random Data Generation

- TEE_GenerateRandom

Symmetric Cipher

- TEE_CipherDoFinal
- TEE_CipherInit
- TEE_CipherUpdate

TA Interface

- TA_CloseSessionEntryPoint
- TA_CreateEntryPoint
- TA_DestroyEntryPoint
- TA_InvokeCommandEntryPoint
- TA_OpenSessionEntryPoint

Time

- TEE_GetREETime
- TEE_GetSystemTime
- TEE_GetTAPersistentTime
- TEE_SetTAPersistentTime
- TEE_Wait

Transient Object

- TEE_AllocateTransientObject
- TEE_CopyObjectAttributes (deprecated)
- TEE_CopyObjectAttributes1
- TEE_FreeTransientObject
- TEE_GenerateKey
- TEE_InitRefAttribute
- TEE_InitValueAttribute
- TEE_PopulateTransientObject
- TEE_ResetTransientObject

3 How to run sample TA programs on ta-ref

Currently ta-ref supports writing TA's for three targets namely

- Keystone
- OP-TEE
- Intel SGX

The pre-built ta-ref docker images for all three targets are already available. The details are mentioned below

Target	docker image
Keystone	trasioteam/taref-dev:keystone
OP-TEE	trasioteam/taref-dev:optee
Intel SGX	trasioteam/taref-dev:sgx

3.1 Run samples for Keystone

Sample to be executed : **message_digest**

Docker Image : **trasioteam/taref-dev:keystone**

Following are the steps to be executed to run samples for Keystone.

```
# Pull the docker image
$ docker pull trasioteam/taref-dev:keystone

#Run the docker image
$ docker run -it trasioteam/taref-dev:keystone

# [Inside docker image]
# Initially you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.

# Changes to ta-ref folder
$ cd ${TAREF_DIR}

# Move to keystone build directory
$ cd samples/message_digest/build-keystone/

# Make the message-digest sample
$ make

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root
# Password: sifive

# [Inside Qemu Console]
# Execute the sample and see the output
# Load the keystone driver
$ insmod keystone-driver.ko

# Run the message-digest program
$ ./App-keystone

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

Following is the output inside qemu when you execute the sample program.

```
# insmod keystone-driver.ko
[ 90.867089] keystone_driver: loading out-of-tree module taints kernel.
[ 90.877175] keystone_enclave: keystone enclave v1.0.0

3.2 Run samples for OP-TEE

Sample to be executed : **message_digest**

Docker Image : **trasioteam/taref-dev:optee**

Following are the steps to be executed to run samples for OP-TEE.

```
# Pull the docker image
$ docker pull trasio team/taref-dev:optee

# Run the docker image
$ docker run -it trasio team/taref-dev:optee

# [Inside docker image]
# Initially you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.
$ cd ${TAREF_DIR}

# Move to Optee build directory
$ cd samples/message_digest/build-optee/

# Make the message-digest sample
$ make

# Make the qemu
make install_qemu

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root

# [Inside Qemu Console]
# Execute the sample and see the output
# Run the message-digest program
./App-optee
```

```
# The output of the program is not displayed inside qemu.
# Inside the docker, it cannot open two console, one for Linux and one for optee,
# so saving the console output to file for optee. It is saved inside the serial.log

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

To view the output, open the serial log file by executing the following command outside qemu.

```
$ cat /home/user/optee/out/bin/serial1.log

hash: be 45 cb 26 05 bf 36 be bd e6 84 84 1a 28 f0 fd 43 c6 98 50 a3 dc e5 fe db a6 99 28 ee 3a 89

#
```

3.3 Run samples for Intel SGX

Sample to be executed : **message_digest**

Docker Image : **trasioteam/taref-dev:sgx**

Following are the steps to be executed to run samples for SGX.

```
# Pull the docker image
$ docker pull trasioteam/taref-dev:sgx

# Run the docker image
$ docker run -it trasioteam/taref-dev:sgx

# [Inside docker image]
# Initally you would be logged-in as build-user.
# If you are root user, change to build-user using # su build-user command.
$ cd ${TAREF_DIR}

# Move to SGX build directory
$ cd samples/message_digest/build-sgx/

# Make the message-digest sample for Simulation mode
$ make
# This creates the App_sgx and enclave.signed.so
# You can copy this two files alone to any places and run the App_sgx
$ ./App_sgx
```

Trimmed the output in the App_sgx shown below

```
.
.
[read_cpusvn_file ../cpusvn_util.cpp:96] Couldn't find/open the configuration file

4 How to write your first 'Hello World' TA Program

To explain the steps to write our first TA program, we are going to write a simple 'Hello World' TA.

4.1 Step 1: Run the docker image

Run the ta-ref pre-built docker for keystone/optee/sgx depending on your purpose.

For Keystone,

```
$ docker run -it trasioteam/taref-dev:keystone
```

For OP-TEE,

```
$ docker run -it trasioteam/taref-dev:optee
```

For SGX,

```
$ docker run -it trasioteam/taref-dev:sgx
```

4.2 Step 2: Copy sample directory and modify

Copy the sample 'message_digest' and rename to the name you need.

```
$ cd ${TAREF_DIR}
$ cp -r samples/message_digest/ hello_world_ta
```

Have a look on the directory structure below.

```

build-user@39ddcd17144c:~/ta-ref$ tree hello_world_ta/
hello_world_ta/
├── App-keystone.cpp
├── App-optee.c
├── App-sgx.cpp
├── build-keystone
│   └── Makefile
├── build-optee
│   ├── app.mk
│   ├── enclave.mk
│   ├── Makefile
│   ├── sub.mk
│   └── user_ta_header_defines.h
├── build-sgx
│   ├── app.mk
│   ├── config
│   │   └── Enclave.config.xml
│   └── Enclave.lds

```

```

|
|   ├── enclave.mk
|   ├── Enclave_private.pem
|   ├── Makefile
|   └── Enclave.c

```

Basically we need to modify two files

1) Enclave.c (Common to all three targets)

2) App-<target>.c

- App-keystone.cpp (Incase of Keystone)
- App-optee.c (Incase of OP-TEE)
- App-sgx.cpp (Incase of SGX)

4.3 Step 3 : Modifications to Enclave.c

Enclave.c is the place where we write the business logic. In our case, our business logic is to print the text 'Hello World'.

4.3.1 What to modify

Look for the `#define` statement `TA_InvokeCommandEntryPoint()` function. This is the place we are going to modify

Before modification

```

#define TA_REF_HASH_GEN      0x11111111
#define TA_REF_HASH_CHECK   0x22222222
TEE_Result TA_InvokeCommandEntryPoint(void *sess_ctx,
                                      uint32_t cmd_id,
                                      uint32_t param_types, TEE_Param params[4])
{
    int ret = TEE_SUCCESS;
    switch (cmd_id) {
        case TA_REF_HASH_GEN:
            message_digest_gen();
            return TEE_SUCCESS;
        case TA_REF_HASH_CHECK:
            ret = message_digest_check();
            if (ret != TEE_SUCCESS)
                ret = TEE_ERROR_SIGNATURE_INVALID;
            return ret;
        default:
            return TEE_ERROR_BAD_PARAMETERS;
    }
}

```

After Modification

```

#define TA_REF_PRINT_HELLO   0x11111111
TEE_Result TA_InvokeCommandEntryPoint(void *sess_ctx,
                                      uint32_t cmd_id,
                                      uint32_t param_types, TEE_Param params[4])
{
    int ret = TEE_SUCCESS;
    switch (cmd_id) {
        case TA_REF_PRINT_HELLO:
            tee_printf("Hello World \n");
            return TEE_SUCCESS;
        default:

```

```

        return TEE_ERROR_BAD_PARAMETERS;
    }
}

```

In the modification, we have removed the existing switch cases and added a new case to print 'Hello World' text. Various functions available to be used here are shown in Chapter 2 and few important functions are explained in detail below.

Please save your changes and exit Enclave.c

4.4 Step 4 : Modifications to App-<target>.c

4.4.1 Modification to App-keystone.cpp

App-keystone.cpp is the main function which invokes Enclave.c. The objective is to call the [TA_InvokeCommandEntryPoint\(\)](#) which we modified in the previous step.

What to modify

Before Modification

```

#define TA_REF_HASH_GEN    0x11111111
#define TA_REF_HASH_CHECK 0x22222222
// Inside main() function
run_enclave(TA_REF_HASH_GEN);
run_enclave(TA_REF_HASH_CHECK);

```

After modification

```

#define TA_REF_PRINT_HELLO    0x11111111
// Inside main() function
run_enclave(TA_REF_PRINT_HELLO);

```

4.4.2 Modification to App-optee.cpp

App-optee.c is the main function which invokes Enclave.c. The objective is to call the [TA_InvokeCommandEntryPoint\(\)](#) which we modified in the previous step.

What to modify

Look for the #define statement and [main\(void\)](#) function in the program

Before modification

```

#define TA_REF_HASH_GEN    0x11111111
#define TA_REF_HASH_CHECK 0x22222222
// Inside main(void) function
res = TEEC_InvokeCommand(&sess, TA_REF_HASH_GEN, &op,
                        &err_origin);
res = TEEC_InvokeCommand(&sess, TA_REF_HASH_CHECK, &op,
                        &err_origin);

```

After modification

```

#define TA_REF_PRINT_HELLO    0x11111111
// Inside main(void) function
res = TEEC_InvokeCommand(&sess, TA_REF_PRINT_HELLO, &op,

```

```
&err_origin);
```

4.4.3 Modification to App-sgx.cpp

App-sgx.c is the main function which invokes Enclave.c. The objective is to call the [TA_InvokeCommandEntryPoint\(\)](#) which we modified in the previous step.

What to modify

Look for the `#define` statement and `main(void)` function in the program

Before modification

```
#define TA_REF_HASH_GEN    0x11111111
#define TA_REF_HASH_CHECK 0x22222222
// Inside main(void) function
/* Calling Trusted Application */
ret = ecall_ta_main(global_eid, TA_REF_HASH_GEN);
if (ret != SGX_SUCCESS)
    goto main_out;
ret = ecall_ta_main(global_eid, TA_REF_HASH_CHECK);
if (ret != SGX_SUCCESS)
    goto main_out;
```

After modification

```
#define TA_REF_PRINT_HELLO    0x11111111
// Inside main(void) function
/* Calling Trusted Application */
ret = ecall_ta_main(global_eid, TA_REF_PRINT_HELLO);
if (ret != SGX_SUCCESS)
    goto main_out;
```

4.5 Step 5 : Execute the Hello World TA

4.5.1 Execute the 'Hello World' TA for Keystone

Change directory to the build-keystone directory.

```
# Change to build-<target> directory
$ cd build-keystone

# Make the TA
$ make

# Run the qemu console
$ make run-qemu

# This opens us qemu console and login using
# buildroot login: root
# Password: sifive
#

# [Inside Qemu Console]
# Execute the sample and see the output
# Load the keystone driver
$ insmod keystone-driver.ko
# Run the message-digest program
$ ./App-keystone
# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

Here you can see the text 'Hello World' printed in the log.

4.5.2 Execute the 'Hello World' TA for OP-TEE

Change directory to the build-optee directory.

```
# Change to build-<target> directory
$ cd build-optee

# Make the TA
$ make

# After successful make of TA, Make the qemu
$ make install_qemu

# Run the qemu console
$ make run-qemu
# This opens us qemu console and login using
# buildroot login: root

# [Inside Qemu Console]
# Execute the create TA program
# No output is shown inside qemu, its stored in serial.log
# ./App-optee
# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

To view the output, open the serial log file by executing the following command outside qemu.

```
$ cat /home/user/optee/out/bin/serial1.log

[Trimmed output]
D/TC:? 0 tee_ta_close_session:518 Destroy session
**Hello World**
D/TC:? 0 tee_ta_close_session:499 csess 0x3293e860 id 1
D/TC:? 0 tee_ta_close_session:518 Destroy session
```

Here you can see the text 'Hello World' printed in the log.

4.5.3 Execute the 'Hello World' TA for Intel SGX

Change directory to the build-sgx directory.

```
# Change to build-<target> directory
$ cd build-sgx

# Make the TA
$ make

# Make the message-digest sample for Simulation mode
$ make

# This creates the App_sgx and enclave.signed.so
# You can copy this two files alone to any places and run the App_sgx
$ ./App_sgx

# Exit the qemu console by clicking Ctrl-A X or $ poweroff command
### Ctrl-a x
```

Here you can see the text 'Hello World' printed in the log.

5 AIST supported GP API's in TA's

Following are the set of AIST supported GP API's that can be used when writing your own TA is shown below.

5.1 Time Functions

This function retrieves the current time as seen from the point of view of the REE, which expressed in the number of seconds and prints the "GP REE second and millisecond".

```

--- start Ree time ---
void gp_ree_time_test(void)
{
    TEE_Time time;

    /* REE time */
    TEE_GetREETime(&time);

    tee_printf("@GP REE time %u sec %u millis\n", time.seconds, time.millis);
}
--- end Ree Time ---

```

This function retrieves the current system time as seen from the point of view of the TA, which expressed in the number of seconds and print the "GP System time second and millisecond".

```

--- start System time ---
void gp_trusted_time_test(void)
{
    TEE_Time time;

    /* System time */
    TEE_GetSystemTime(&time);

    tee_printf("@GP System time %u sec %u millis\n", time.seconds, time.millis);
}
--- end System time ---

```

5.2 Random Functions

This function generates the random data by invoking TEE_GenerateRandom function and it prints the generated random data.

```

--- start Random ---
void gp_random_test(void)
{
    unsigned char rbuf[16];

    // Generate Random
    TEE_GenerateRandom(rbuf, sizeof(rbuf));

    tee_printf("@random: ");
    for (int i = 0; i < sizeof(rbuf); i++) {
        tee_printf("%02x", rbuf[i]);
    }
    tee_printf("\n");
}
--- end Random ---

```

5.3 Hash Functions

Pseudo code of how to use Message Digest Functions. Keystone uses sha3.c which is almost identical. The function performs many operations to achieve message data hash techniques to allocate the handle for a new cryptographic operation. And then finalize the message digest operation to produce the message hash. It prints the hash message.

```

--- start Message Digest ---
void gp_message_digest_test(void)
{
    static unsigned char data[256] = {
        #include "test.dat"
    };
    unsigned char hash[SHA_LENGTH];
    uint32_t hashlen = SHA_LENGTH;
    TEE_OperationHandle handle;
    TEE_Result rv;

```

```

// Take hash of test data
/* sha3_init() in sha3.c */
rv = TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
GP_ASSERT(rv, "TEE_AllocateOperation fails");

/* sha3_update() in sha3.c */
TEE_DigestUpdate(handle, data, sizeof(data));

/* sha3_final() in sha3.c */
rv = TEE_DigestDoFinal(handle, NULL, 0, hash, &hashlen);
GP_ASSERT(rv, "TEE_DigestDoFinal fails");

TEE_FreeOperation(handle);
/* hash value is ready */
// Dump hashed data
tee_printf("hash: ");
for (int i = 0; i < hashlen; i++) {
    tee_printf(" %02x", hash[i]);
}
tee_printf("\n");
}
--- end Message Digest ---

```

5.4 Symmetric Crypto Functions

Crypto, Authenticated Encryption with Symmetric Key Verification Functions. This function allocates an uninitialized transient object, i.e. a container for attributes. Transient objects are used to hold a cryptographic object (key or key-pair). With the generation of a key, a new cryptographic operation for encrypt and decrypt data is initiated with a symmetric cipher operation. The original data is compared with decrypted data by checking the data and its length.

```

--- start Symmetric Key Encryption ---
void gp_symmetric_key_enc_verify_test(void)
{
    TEE_OperationHandle handle;

    static unsigned char data[CIPHER_LENGTH] = {
        // 0x00, 0x01, ..., 0xff
        #include "test.dat"
    };
    uint8_t iv[16];
    unsigned char out[CIPHER_LENGTH];
    uint32_t outlen;

    TEE_ObjectHandle key;
    TEE_Result rv;

    // Generate key
    rv = TEE_AllocateTransientObject(TEE_TYPE_AES, 32*8, &key);
    GP_ASSERT(rv, "TEE_AllocateTransientObject fails");

    rv = TEE_GenerateKey(key, 256, NULL, 0);
    GP_ASSERT(rv, "TEE_GenerateKey fails");

    // Encrypt test data
    rv = TEE_AllocateOperation(&handle, TEE_ALG_AES_CBC_NOPAD, TEE_MODE_ENCRYPT, 256);
    GP_ASSERT(rv, "TEE_AllocateOperation fails");

    rv = TEE_SetOperationKey(handle, key);
    GP_ASSERT(rv, "TEE_SetOperationKey fails");

    TEE_GenerateRandom(iv, sizeof(iv));
    TEE_CipherInit(handle, iv, sizeof(iv));
    //GP_ASSERT(rv, "TEE_AEInit fails");

    outlen = CIPHER_LENGTH;
    rv = TEE_CipherUpdate(handle, data, CIPHER_LENGTH, out, &outlen);
    GP_ASSERT(rv, "TEE_CipherUpdate fails");

    TEE_FreeOperation(handle);

    // Dump encrypted data
    tee_printf("@cipher: ");
    for (int i = 0; i < CIPHER_LENGTH; i++) {
        tee_printf(" %02x", out[i]);
    }
    tee_printf("\n");

    // Decrypt it

```

```

rv= TEE_AllocateOperation(&handle, TEE_ALG_AES_CBC_NOPAD, TEE_MODE_DECRYPT, 256);
GP_ASSERT(rv, "TEE_AllocateOperation fails");

rv = TEE_SetOperationKey(handle, key);
GP_ASSERT(rv, "TEE_SetOperationKey fails");

TEE_CipherInit(handle, iv, sizeof(iv));
//GP_ASSERT(rv, "TEE_AEInit fails");

outlen = CIPHER_LENGTH;
rv = TEE_CipherUpdate(handle, out, CIPHER_LENGTH, out, &outlen);
GP_ASSERT(rv, "TEE_CipherUpdate fails");

TEE_FreeOperation(handle);
TEE_FreeTransientObject(key);

// Dump data
tee_printf("decrypted to: ");
for (int i = 0; i < CIPHER_LENGTH; i++) {
    tee_printf ("%02x", out[i]);
}
tee_printf("\n");

// Verify decrypted data against original one
int verify_ok;
verify_ok = !memcmp(out, data, CIPHER_LENGTH);
if (verify_ok) {
    tee_printf("verify ok\n");
} else {
    tee_printf("verify fails\n");
}
}
--- end Symmetric Key Encryption ---

```

5.5 Symmetric Crypto AES-GCM Functions

This function encrypt and decrypt the test data. The function allocates an uninitialized transient object, i.e. a container for attributes. Transient objects are used to hold a cryptographic object (key or key-pair). With the generation of a key, a new cryptographic operation for encrypt and decrypt data is initiated with a symmetric cipher operation. The data is also checked whether it is completely encrypted or decrypted. The original data is compared with decrypted data by checking the data and cipher length.

```

--- start Symmetric Key GCM ---
void gp_symmetric_key_gcm_verify_test(void)
{
    TEE_OperationHandle handle;

    static unsigned char data[CIPHER_LENGTH] = {
        // 0x00,0x01,...,0xff
        #include "test.dat"
    };

    uint8_t iv[16];
    unsigned char out[CIPHER_LENGTH];
    uint32_t outlen;
    unsigned char tag[16];

    TEE_ObjectHandle key;
    TEE_Result rv;

    // Generate key
    rv = TEE_AllocateTransientObject(TEE_TYPE_AES, 256, &key);
    GP_ASSERT(rv, "TEE_AllocateTransientObject fails");

    rv = TEE_GenerateKey(key, 256, NULL, 0);
    GP_ASSERT(rv, "TEE_GenerateKey fails");

    // Encrypt test data
    rv = TEE_AllocateOperation(&handle, TEE_ALG_AES_GCM, TEE_MODE_ENCRYPT, 256);
    GP_ASSERT(rv, "TEE_AllocateOperation fails");

    rv = TEE_SetOperationKey(handle, key);
    GP_ASSERT(rv, "TEE_SetOperationKey fails");

    TEE_GenerateRandom(iv, sizeof(iv));

    /* Equivalent in openssl is EVP_EncryptInit_ex() */

```

```

rv = TEE_AEInit(handle, iv, sizeof(iv), 16*8, 16, 16);
GP_ASSERT(rv, "TEE_AEInit fails");

/* Equivalent in openssl is EVP_EncryptUpdate() */
// rv = TEE_AEUpdateAAD(handle, aad, 16);
// GP_ASSERT(rv, "TEE_AEUpdateAAD fails");

unsigned int taglen = 16;
memset(tag, 0, 16);

outlen = CIPHER_LENGTH;

/* Equivalent in openssl is EVP_EncryptFinal() */
rv = TEE_AEEncryptFinal(handle, data, 256, out, &outlen, tag, &taglen);

TEE_FreeOperation(handle);

/* Get the auth_tag */
// Dump encrypted data and tag
tee_printf("@cipher: ");
for (int i = 0; i < CIPHER_LENGTH; i++) {
    tee_printf ("%02x", out[i]);
}
tee_printf("\n");
tee_printf("@tag: ");
for (int i = 0; i < 16; i++) {
    tee_printf ("%02x", tag[i]);
}
tee_printf("\n");

// Decrypt it
rv = TEE_AllocateOperation(&handle, TEE_ALG_AES_GCM, TEE_MODE_DECRYPT, 256);
GP_ASSERT(rv, "TEE_AllocateOperation fails");

rv = TEE_SetOperationKey(handle, key);
GP_ASSERT(rv, "TEE_SetOperationKey fails");

/* Equivalent in openssl is EVP_DecryptInit_ex() */
rv = TEE_AEInit(handle, iv, sizeof(iv), 16*8, 16, 16);
GP_ASSERT(rv, "TEE_AEInit fails");

// rv = TEE_AEUpdateAAD(handle, aad, 16);
// GP_ASSERT(rv, "TEE_AEUpdateAAD fails");

unsigned char decode[CIPHER_LENGTH];
outlen = 256;
/* Equivalent in openssl require two functions
EVP_CIPHER_CTX_ctrl(tag) and EVP_DecryptFinal(others) */
rv = TEE_AEDecryptFinal(handle, out, 256, decode, &outlen, tag, 16);
GP_ASSERT(rv, "TEE_AEDecryptFinal fails");

TEE_FreeOperation(handle);
TEE_FreeTransientObject(key);

// Dump data and tag
tee_printf("decrypted to: ");

    tee_printf("verify ok\n");
} else {
    tee_printf("verify fails\n");
}
}

--- end Symmetric Key GCM ---

```

5.6 Asymmetric Crypto Functions

Crypto, Sign and Verify with Asymmetric Key Verification Functions. Cryptographic Operations for API Message Digest Functions. The function performs cryptographic operation for API Message. To achieve this, the function allocates a handle for a new cryptographic operation, to finalize the message digest operation and to produce the

message hash. The Hashed data is signed with signature key within an asymmetric operation. The original Hashed Data and Signed hashed data is compared for ok status.

```

--- start Asymmetric Key Signed ---
void gp_asymmetric_key_sign_test(void)
{
    static unsigned char data[256] = {
        // 0x00,0x01,...,0xff
        #include "test.dat"
    };
    unsigned char hash[SHA_LENGTH];
    unsigned char sig[SIG_LENGTH];
    uint32_t hashlen = SHA_LENGTH;
    TEE_OperationHandle handle;
    TEE_Result rv;

    // Take hash of test data
    /* Calculate hash */
    /* sha3_init() in sha3.c */
    rv = TEE_AllocateOperation(&handle, TEE_ALG_SHA256, TEE_MODE_DIGEST, SHA_LENGTH);
    GP_ASSERT(rv, "TEE_AllocateOperation fails");

    /* sha3_update() in sha3.c */
    TEE_DigestUpdate(handle, data, sizeof(data));

    /* sha3_final() in sha3.c */
    rv = TEE_DigestDoFinal(handle, NULL, 0, hash, &hashlen);
    GP_ASSERT(rv, "TEE_DigestDoFinal fails");

    /* free up */
    TEE_FreeOperation(handle);
    /* Get the signature */

    // Dump hashed data
    tee_printf("@digest: ");
    for (int i = 0; i < SHA_LENGTH; i++) {
        tee_printf ("%02x", hash[i]);
    }
    tee_printf("\n");

    uint32_t siglen = SIG_LENGTH;
    TEE_ObjectHandle keypair;

    // Sign hashed data with the generated keys
    /* set ecdsa_p256 key */
    rv = TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256, TEE_MODE_SIGN, 256);
    GP_ASSERT(rv, "TEE_AllocateOperation fails");

    // Generate keypair
    rv = TEE_AllocateTransientObject(TEE_TYPE_ECDSA_KEYPAIR, 256, &keypair);
    GP_ASSERT(rv, "TEE_AllocateTransientObject fails");

    TEE_Attribute attr;
    TEE_InitValueAttribute(&attr,
        TEE_ATTR_ECC_CURVE,
        TEE_ECC_CURVE_NIST_P256,
        256);
    rv = TEE_GenerateKey(keypair, 256, &attr, 1);
    GP_ASSERT(rv, "TEE_GenerateKey fails");

    rv = TEE_SetOperationKey(handle, keypair);
    GP_ASSERT(rv, "TEE_SetOperationKey fails");

    /* Keystone has ecdsa_p256_sign() Equivalent in openssl is EVP_DigestSign() */
    rv = TEE_AsymmetricSignDigest(handle, NULL, 0, hash, hashlen, sig, &siglen);
    GP_ASSERT(rv, "TEE_AsymmetricSignDigest fails");

    /* free up */
    TEE_FreeOperation(handle);

    /* Get the signature */
    // Dump signature
    tee_printf("@signature: ");
    for (uint32_t i = 0; i < siglen; i++) {
        tee_printf ("%02x", sig[i]);
    }
    tee_printf("\n");

    // Verify signature against hashed data
    /* set ecdsa_p256 key */
    rv = TEE_AllocateOperation(&handle, TEE_ALG_ECDSA_P256, TEE_MODE_VERIFY, 256);
    GP_ASSERT(rv, "TEE_AllocateOperation fails");

    rv = TEE_SetOperationKey(handle, keypair);
    GP_ASSERT(rv, "TEE_SetOperationKey fails");
}

```

```

/* Keystone has ecdsa_p256_verify() Equivalent in openssl is EVP_DigestVerify() */
TEE_Result verify_ok;
verify_ok = TEE_AsymmetricVerifyDigest(handle, NULL, 0, hash, hashlen, sig, siglen);

/* free up */
TEE_FreeOperation(handle);
tee_printf("@@TEE_FreeOperation: \n");

TEE_FreeTransientObject(keypair);

if (verify_ok == TEE_SUCCESS) {
    tee_printf("verify ok\n");
} else {
    tee_printf("verify fails\n");
}
}

/* Check verify_ok for success of verification */
--- end Asymmetric Key Signed ---

```

5.7 Open, Read, Write, Close On Secure Storage

Core Functions, Secure Storage Functions. Pseudo code of how to use Secure Storage. These could be implemented using ocall on Keystone. Almost identical to open(), clone(), read(), write() in POSIX API. The function creates a persistent object for reading and writing the data. The created data individually for read and write are compared for data length. If the length of both the objects are same, the function prints "verify ok" and prints "verify fails" if it is not the same.

```

--- start Secure storage ---
void gp_secure_storage_test(void)
{
    static unsigned char data[] = {
        // 0x00,0x01,...,0xff
        #include "test.dat"
    };
    static unsigned char buf[DATA_LENGTH];

    TEE_Result rv;

    /* write */
    TEE_ObjectHandle object;
    rv = TEE_CreatePersistentObject(TEE_STORAGE_PRIVATE,
        "FileOne", strlen("FileOne"),
        (TEE_DATA_FLAG_ACCESS_WRITE
         | TEE_DATA_FLAG_OVERWRITE),
        TEE_HANDLE_NULL,
        NULL, 0,
        &object);
    GP_ASSERT(rv, "TEE_CreatePersistentObject fails");

    memcpy(buf, data, DATA_LENGTH);

    /* fill the date in buffer */
    rv = TEE_WriteObjectData(object, (const char *)data, DATA_LENGTH);
    GP_ASSERT(rv, "TEE_WriteObjectData fails");

    TEE_CloseObject(object);
    --- write file end ---

    /* clear buf */
    memset(buf, 0, DATA_LENGTH);

    --- read file start ---
    /* read */
    rv = TEE_OpenPersistentObject(TEE_STORAGE_PRIVATE,
        "FileOne", strlen("FileOne"),
        TEE_DATA_FLAG_ACCESS_READ,
        &object);
    GP_ASSERT(rv, "TEE_OpenPersistentObject fails");

    uint32_t count;
    rv = TEE_ReadObjectData(object, (char *)buf, DATA_LENGTH, &count);

    GP_ASSERT(rv, "TEE_ReadObjectData fails");
    TEE_CloseObject(object);

    /* use the date in buffer */

```

```

tee_printf("%d bytes read: ", count);
for (uint32_t i = 0; i < count; i++) {
    tee_printf ("%02x", buf[i]);
}
tee_printf("\n");

/* Compare read data with written data */
int verify_ok;
verify_ok = !memcmp(buf, data, DATA_LENGTH);
if (verify_ok) {
    tee_printf("verify ok\n");
} else {
    tee_printf("verify fails\n");
}
}

--- end Secure storage ---

```

6 Preparation and building ta-ref with docker

6.1 Preparation

For building ta-ref with docker, it is required to install docker on Ubuntu.

For the first time users of docker, please have a look on <https://docs.docker.com/engine/>

The following installation steps is for Ubuntu 20.04

6.1.1 Installing Docker

```
$ sudo apt update

# Next, install a few prerequisite packages which let apt use packages over HTTPS:
$ sudo apt install apt-transport-https ca-certificates curl software-properties-common

# Then add the GPG key for the official Docker repository to your system:
$ curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -

# Add the Docker repository to APT sources:
$ sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu focal stable"

# This will also update our package database with the Docker packages from the newly added repo.
# Make sure you are about to install from the Docker repo instead of the default Ubuntu repo:
$ apt-cache policy docker-ce

#Finally, install Docker
$ sudo apt install docker-ce
```

6.1.2 Executing Docker without sudo

By default, the docker command can only be run the root user or by a user in the docker group, which is automatically created during Docker's installation process. If you attempt to run the docker command without prefixing it with sudo or without being in the docker group, you'll get an output like this:

```
docker: Cannot connect to the Docker daemon. Is the docker daemon running on this host?.
```

To avoid typing sudo whenever we run the docker command, add your username to the docker group.

```
$ sudo groupadd docker
$ sudo gpasswd -a $USER docker
# Logout and then log-in again to apply the changes to the group
```

After you logout and login, you can probably run the docker command without sudo

```
$ docker run hello-world
```

6.1.3 Create a docker network tamproto

A docker network named tamproto is required when we run ta-ref for Keystone. The local network is required to connect with tamproto service running locally.

```
$ docker network create tamproto_default
```

6.2 Docker images details

The docker images with all necessary packages for building ta-ref for all three targets are already available. Make sure you have account on docker-hub. If not please create one on dockerhub.com. The details are mentioned below

Target	docker image
Keystone	aistcpsec/tee-dev:keystone-1.0.0
OP-TEE	aistcpsec/tee-dev:optee-3.10.0
Intel SGX	aistcpsec/tee-dev:sgx-2.10

6.3 Building ta-ref with Docker

6.3.1 Building ta-ref for Keystone with docker

Following commands are to be executed on Ubuntu 20.04.

```
# Clone the ta-ref repo and checkout teep-master branch
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref/
$ git checkout teep-master

# Sync and update the submodules
$ git submodule sync --recursive
$ git submodule update --init --recursive

# Start the docker
$ docker run --network tamproto_default -it --rm -v $(pwd):/home/user/ta-ref
aistcpsec/tee-dev:keystone-1.0.0
```

After you start the docker command, you will be logged-in inside the docker container. Following are the commands to be executed inside the docker

```
# [Inside docker image]

$ cd ta-ref/
$ source env/keystone.sh

# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp
```

By the above steps, we have successfully built the ta-ref. Below we are going to push it into qemu and test its working

Test the built test_hello, test_gp binaries in Qemu

```
# Copy the test_hello inside qemu root
$ mkdir $KEYSTONE_DIR/build/overlay/root/test_hello
$ cp test_hello/keystone/App/App.client $KEYSTONE_DIR/build/overlay/root/test_hello/
$ cp test_hello/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/build/overlay/root/test_hello/
$ cp $KEYSTONE_SDK_DIR/runtime/eyrie-rt $KEYSTONE_DIR/build/overlay/root/test_hello/

# Copy the test_gp inside qemu root
$ mkdir $KEYSTONE_DIR/build/overlay/root/test_gp
$ cp test_gp/keystone/App/App.client $KEYSTONE_DIR/build/overlay/root/test_gp/
$ cp test_gp/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/build/overlay/root/test_gp/
$ cp $KEYSTONE_SDK_DIR/runtime/eyrie-rt $KEYSTONE_DIR/build/overlay/root/test_gp/

# Re-build the keystone again to copy test_hello and test_gp inside qemu
$ cd $KEYSTONE_DIR/build
$ make

# Start the Qemu console from $KEYSTONE_DIR/build dir
$ ./scripts/run-qemu.sh

# When asked for username and password use
# username : root
# password : sifive
```

```

# Inside Qemu run the steps to test test_hello and test_gp
# Load keystone driver
$ insmod keystone-driver.ko

# Test test_hello
# cd test_hello/
# ./App.client Enclave.eapp_riscv eyrie-rt

6.3.2 Building ta-ref for OP-TEE with docker

Following commands are to be executed on Ubuntu 20.04.

```

# Clone the ta-ref repo and checkout teep-master branch
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref/
$ git checkout teep-master

# Sync and update the submodules
$ git submodule sync --recursive
$ git submodule update --init --recursive

# Start the docker
$ docker run -it --rm -v $(pwd):/home/user/ta-ref aistcpsec/tee-dev:optee-3.10.0

```

After you start the docker command, you will be logged-in inside the docker container. Following are the commands to be executed inside the docker

```

# [Inside docker image]

$ cd ta-ref/
$ source env/optee_gemu.sh

# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp

```

By the above steps, we have successfully built the ta-ref. Below we are going to push it into qemu and test its working

Test the built test_hello, test_gp binaries in Qemu

```

# Extract the rootfs.cpio.gz into a directory
$ cd ${OPTEE_OUTBR_DIR}/images
$ rm -rf rootfs && mkdir rootfs && cd rootfs
$ gzip -dc ../rootfs.cpio.gz | sudo cpio -i

# Copy the test binaries into the extracted directory
# Create test directories inside root folder and copy the binaries - TEST_HELLO
$ export OPTEE_TEST_HELLO_DIR=${OPTEE_OUTBR_DIR}/images/rootfs/root/test_hello
$ sudo mkdir ${OPTEE_TEST_HELLO_DIR}
$ sudo cp ~/ta-ref/test_hello/optee/App/optee_ref.ta ${OPTEE_TEST_HELLO_DIR}
$ sudo cp ~/ta-ref/test_hello/optee/Enclave/a6f77cle-96fe-4a0e-9e74-262582a4c8f1.ta
  ${OPTEE_TEST_HELLO_DIR}

# Create test directories inside root folder and copy the binaries - TEST_GP
$ export OPTEE_TEST_GP_DIR=${OPTEE_OUTBR_DIR}/images/rootfs/root/test_gp
$ sudo mkdir ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/App/optee_ref.ta ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/Enclave/a6f77cle-96fe-4a0e-9e74-262582a4c8f1.ta
  ${OPTEE_TEST_GP_DIR}
$ sudo cp ~/ta-ref/test_gp/optee/Enclave/Enclave.nm ${OPTEE_TEST_GP_DIR}

# Re-pack the rootfs folder into a cpio archive
$ cd ${OPTEE_OUTBR_DIR}/images/rootfs
$ sudo find . | sudo cpio -o -H newc 2> /dev/null | gzip -c9 > ../rootfs.cpio.gz

# Start the Qemu console from $OPTEE_DIR/build directory
$ ln -sf /home/user/optee/out-br/images/rootfs.cpio.gz /home/user/optee/out/bin
$ cd /home/user/optee/out/bin && \

#

```

6.3.3 Building ta-ref for Intel SGX with docker

Following commands are to be executed on Ubuntu 20.04.

```

# Clone the ta-ref repo and checkout teep-master branch
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref/
$ git checkout teep-master

# Sync and update the submodules
$ git submodule sync --recursive
$ git submodule update --init --recursive

# Start the docker
$ docker run -it --rm -v $(pwd):/home/user/ta-ref aistcpsec/tee-dev:sgx-2.10

```

Commands to be executed inside docker:

```

$ cd ta-ref/

# Source SGX environment variables
$ source /opt/intel/sgxsdk/environment
$ source env/sgx_x64.sh

# Build test_hello directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_hello

# Build test_gp directory
$ make build test-bin MACHINE=SIM TEST_DIR=test_gp

```

By the above steps, we have successfully built the ta-ref. Since we are building in SIM mode, We can execute in docker itself.

There are two files required to test_hello 1) ./sgx_app 2)enclave.signed.so copy the files into a directory and then execute the ./sgx_app command

Test the built test_hello, test_gp binaries in Docker SIM mode

Make sure test_hello is already built in SIM mode. [Inside /home/user directory]

Test_hello:

```

$ cd
$ mkdir test_hello

# Copy the sgx_app for test_hello
$ cp ta-ref/test_hello/sgx/App/sgx_app test_hello/
# Copy the enclave
$ cp ta-ref/test_hello/sgx/Enclave/enclave.signed.so test_hello/

# Change to test_hello
$ cd test_hello/

# Run the program
$ ./sgx_app
# [trimmed output]
hello world!
Info: Enclave successfully returned.

```

Test_gp:

Make sure test_hello is already built in SIM mode. [Inside /home/user directory]

```

$ cd
$ mkdir test_gp

# Copy the sgx_app for test_gp
$ cp ta-ref/test_gp/sgx/App/sgx_app test_gp/
# Copy the enclave
$ cp ta-ref/test_gp/sgx/Enclave/enclave.signed.so test_gp/

# Change to test_gp
$ cd test_gp/

# Run the program
$ ./sgx_app
# [trimmed output]

7 Preparation before building ta-ref without Docker

All the preparation steps below are based on Ubuntu 20.04

7.1 Keystone(RISC-V Unleashed)

Keystone is an open-source TEE framework for RISC-V processors. For more details check,

- <http://docs.keystone-enclave.org/en/latest>

7.1.1 Required Packages

Install the following packages for building ta-ref on Keystone

```
$ sudo apt-get update
# Following packages are required for Keystone
$ sudo apt-get install -y autoconf automake autotools-dev bc bison \
  build-essential curl expat libexpat1-dev flex gawk gcc git gperf libgmp-dev \
  libmpc-dev libmpfr-dev libtool texinfo tmux patchutils zlib1g-dev wget \
  bzip2 patch vim-common lbzip2 python pkg-config libglib2.0-dev libpixmap-1-dev \
  libssl-dev screen device-tree-compiler expect make self unzip cpio rsync cmake \
  p7zip-full
# Following packages are required for clang, keyedge and make run commands in ta-ref.
$ sudo apt-get install -y clang-tools-6.0 libclang-6.0-dev cmake \
  ocaml expect screen sshpass
```

7.1.2 Download RISC-V toolchain and Keystone SDK

Download the keystone sources

```
$ git clone https://github.com/keystone-enclave/keystone.git -b v1.0.0
$ cd keystone
$ ./fast-setup.sh
$ source ./source.sh
```

After executing the `./fast-setup.sh`, the toolchain for RISC-V has been installed at `keystone/riscv/bin` and it adds to your PATH.

Make the following changes to increase the max edge calls

```
sed -i 's/MAX_EDGE_CALL 10$/MAX_EDGE_CALL 1000/' <keystone_dir>/sdk/include/edge/edge_common.h
```

Build the Keystone SDK

Make sure you are in keystone directory.

```
$ cd sdk/
$ mkdir -p build
$ cd build
$ cmake .. $SDK_FLAGS
$ make
$ make install
```

Build the Qemu Image

Make sure you are in keystone directory.

```
$ mkdir -p build
$ cd build
$ cmake ..
$ make
$ make image
```

Launch the QEMU image

Make sure you are in `keystone\build` directory.

```
$ ./scripts/run-qemu.sh
Welcome to Buildroot
```

Login to console with the following credentials

buildroot login = root, Password = sifive

```
buildroot login: root
Password:
$
```

Poweroff the console incase, if you want to exit.

```
$ poweroff
```

You can also use CTRL^A + X to exit Qemu Console.

7.1.3 Run Keystone examples

Run the following commands to generate hello world example programs to be executed on qemu.

Make sure you are in `keystone\build` directory.

```
$ make hello-package
$ cp -r examples/hello ./overlay/root/
# Update the image
$ make image
```

Launch QEMU console

```
$ ./scripts/run-qemu.sh
Welcome to Buildroot
```

Login to console with user=root, passwd=sifive

```
buildroot login: root
Password:
$
```

Run hello example

```
$ insmod keystone-driver.ko
[ 365.354299] keystone_driver: loading out-of-tree module taints kernel.
[ 365.364279] keystone_enclave: keystone enclave v0.2
$ ./hello/hello.ke
Verifying archive integrity... 100% All good.
Uncompressing Keystone vault archive 100%
hello, world!
```

You can also run the tests by executing `./tests.ke`

Poweroff the console incase, if you want to exit.

```
$ poweroff
```

7.2 OP-TEE (ARM64 Raspberry Pi 3 Model B)

OP-TEE is a Trusted Execution Environment (TEE) designed as companion to a non-secure Linux kernel running on Arm. Lets build OP-TEE for QEMU and Raspberry Pi3 Model B development board. For more details check,

- <https://optee.readthedocs.io/en/latest/>

7.2.1 Required Packages

Install the following packages

```
$ sudo dpkg --add-architecture i386
$ sudo apt-get update -y
$ sudo apt-get install -y android-tools-adb android-tools-fastboot autoconf \
  automake bc bison build-essential ccache cscope curl device-tree-compiler \
  expect flex ftp-upload gdisk iasl libattr1-dev libc6:i386 libcap-dev \
  libbfd-dev libftdi-dev libglib2.0-dev libhidapi-dev libncurses5-dev \
  libpixman-1-dev libssl-dev libstdc++6:i386 libtool libz1:i386 make \
  mtools netcat python python-crypto python3-crypto python-pyelftools \
  python3-pycryptodome python3-pyelftools python3-serial vim-common \
  rsync unzip uuid-dev xdg-utils xterm xz-utils zlib1g-dev \
  git python3-pip wget cpio texlive texinfo locales
```

Set the locale to English, to cope with the problem,
<https://github.com/OP-TEE/build/issues/424#issuecomment-631302208>.

```
$ locale-gen en_US.UTF-8
$ export LANG=en_US.UTF-8
$ export LANGUAGE=en_US:en
$ export LC_ALL=en_US.UTF-8
```

7.2.2 Download and build OP-TEE Toolchains 3.10.0

Create the directory to build the OP-TEE toolchains and export the toolchain directory

```
$ mkdir -p /opt/arm-tc
$ export TOOLCHAIN_DIR=/opt/arm-tc
```

Clone and build the OP-TEE toolchain

```
$ git clone https://github.com/OP-TEE/build.git -b 3.10.0
$ cd build
$ sudo make TOOLCHAIN_ROOT=${TOOLCHAIN_DIR} -f toolchain.mk -j2
$ export PATH=${TOOLCHAIN_DIR}/aarch64/bin:${TOOLCHAIN_DIR}/aarch32/bin:${PATH}
```

7.2.3 Download OP-TEE 3.10.0

Install Androi repo to sync the OP-TEE repo

```
$ sudo git config --global user.name "dummy" && \
  sudo git config --global user.email "dummy@gmail.com" && \
  sudo git config --global color.ui false && \
  mkdir ~/bin && \
  curl https://storage.googleapis.com/git-repo-downloads/repo > ~/bin/repo && \
  chmod a+x ~/bin/repo
$ export PATH=$~/bin:${PATH}
```

Get the source code for optee

```
$ mkdir optee && cd optee
$ export OPTEE_DIR=$(pwd)
$ repo init -u https://github.com/OP-TEE/manifest.git -m qemu_v8.xml -b 3.10.0
$ repo sync -j4 --no-clone-bundle
```

7.2.4 Build OP-TEE 3.10.0

```
$ cd ${OPTEE_DIR}/build
$ ln -s ${TOOLCHAIN_DIR} ${OPTEE_DIR}/toolchains
$ make TOOLCHAIN_ROOT=${TOOLCHAIN_DIR} -j`nproc`
```

If build is successfull, the rootfs can be found as follows

```
$ ls -l ${OPTEE_DIR}/out-br/images/rootfs.cpio.gz
```

7.2.4.1 Clone and Build OP-TEE v3.9.0 for RPI3

Copy the following lines into "optee-rpi3.sh" script

```
#!/bin/bash -u
export OPTEE_VER=$1
export OPTEE_DIR=${PWD}/optee_${OPTEE_VER}_rpi3
mkdir ${OPTEE_DIR} || true
cd ${OPTEE_DIR}
~/bin/repo init -u https://github.com/knknkn1162/manifest.git -m rpi3.xml -b ${OPTEE_VER}
~/bin/repo sync -j4 --no-clone-bundle
ln -s ~/toolchains ${OPTEE_DIR}/. || true
echo 'CONFIG_CMDLINE="console=ttyAMA0,115200 kgdboc=ttyAMA0,115200 root=/dev/mmcblk0p2
rootfstype=ext4 noinitrd rw rootwait init=/lib/systemd/systemd"' > build/defconfig-cmdline.txt
cd build
make OPTEE_CLIENT_BIN_ARCH_EXCLUDE=/boot
LINUX_DEFCONFIG_COMMON_FILES=${OPTEE_DIR}/linux/arch/arm64/configs/bcmrpi3_defconfig
${OPTEE_DIR}/build/kconfigs/rpi3.conf ${OPTEE_DIR}/build/defconfig-cmdline.txt "
BR2_PACKAGE_OPTEE_OS_EXT=n BR2_PACKAGE_OPTEE_TEST_EXT=n
BR2_PACKAGE_OPTEE_EXAMPLES_EXT=n BR2_TOOLCHAIN_EXTERNAL_GCC_8=y BR2_TOOLCHAIN_EXTERNAL_HEADERS_4_19=y
BR2_HOST_GCC_AT_LEAST_8=y
BR2_TOOLCHAIN_HEADERS_AT_LEAST="4.19" -j`nproc`
```

Run the script as follows

```
$ chmod +x optee-rpi3.sh
$ ./optee-rpi3.sh 3.9.0
```

If build is successful, the rootfs can be found as follows

```
$ ls -l ../out-br/images/rootfs.cpio.gz
```

7.2.5 Run OP-TEE Examples

7.2.5.1 Launching QEMU Console

Run following commands from OP-TEE build directory

```
$ cd $OPTEE_DIR/build
$ make run
```

Once above command is success, QEMU is ready

```
* QEMU is now waiting to start the execution
* Start execution with either a 'c' followed by <enter> in the QEMU console or
* attach a debugger and continue from there.
*
* To run OP-TEE tests, use the xtest command in the 'Normal World' terminal
* Enter 'xtest -h' for help.
cd /TEE/demo/rpi3/optee_3.9.0_qemu/build/./out/bin
&& /TEE/demo/rpi3/optee_3.9.0_qemu/build/./qemu/aarch64-softmmu/qemu-system-aarch64 \
-nographic \
-serial tcp:localhost:54320 -serial tcp:localhost:54321 \
-smp 2 \
-s -S -machine virt,secure=on -cpu cortex-a57 \
-d unimp -semihosting-config enable,target=native \
-m 1057 \
-bios b11.bin \
-initrd rootfs.cpio.gz \
-kernel Image -no-acpi \
-append 'console=ttyAMA0,38400 keep_bootcon root=/dev/vda2' \
-object rng-random,filename=/dev/urandom,id=rng0 -device virtio-rng-pci,rng=rng0,max-bytes=1024,
period=1000 -netdev user,id=vmnic -device virtio-net-device,netdev=vmnic
QEMU 3.0.93 monitor - type 'help' for more information
(qemu) c
```

```
Now Optee started to boot from another tab on the Terminal
```

7.2.5.2 Run hello world example

Once boot completed it displays following message, then enter "root" to login to the shell

```
Welcome to Buildroot, type root or test to login
buildroot login: root
$
$ optee_example_hello_world
Invoking TA to increment 42
TA incremented value to 43
```

Poweroff the console in case, if you want to exit.

```
$ poweroff
```

7.3 SGX (Intel NUC)

Intel(R) Software Guard Extensions (Intel(R) SGX) is an Intel technology for application developers who is seeking to protect selected code and data from disclosure or modification. For more details check,

- <https://github.com/intel/linux-sgx/blob/master/README.md>

7.3.1 List of machines which are confirmed to work

1. Intel NUC7PJYH - Intel(R) Celeron(R) J4005 CPU @ 2.00GHz
2. Intel NUC7PJYH - Intel(R) Pentium(R) Silver J5005 CPU @ 1.50GHz
3. Intel NUC9VXQNX - Intel(R) Xeon(R) E-2286M CPU @ 2.40GHz (Partially working)

7.3.2 BIOS Versions which are failed or succeeded in IAS Test

1. BIOS Version JYGLKCPX.86A.0050.2019.0418.1441 - IAS Test was Failed
2. BIOS Version JYGLKCPX.86A.0053.2019.1015.1510 - IAS Test was Failed
3. BIOS Version JYGLKCPX.86A.0057.2020.1020.1637 - IAS Test was Success
4. BIOS Version QNCFLX70.0034.2019.1125.1424 - IAS Test was Failed
5. BIOS Version QNCFLX70.0059.2020.1130.2122 - IAS Test was Success

Update BIOS from:

- <https://downloadcenter.intel.com/download/29987/BIOS-Update-JYGLKCPX->
- <https://downloadcenter.intel.com/download/30069/BIOS-Update-QNCFLX70->

7.3.3 BIOS Settings

1. Make sure you are running with latest version BIOS
2. Make sure you enabled SGX support in BIOS
3. Make sure Secure Boot disabled in BIOS

Refer: <https://github.com/intel/sgx-software-enable/blob/master/README.md>

7.3.4 Required Packages

Intall following packages on Ubuntu 18.04

```
$ sudo apt-get install build-essential ocaml ocamlbuild automake autoconf libtool wget python
libssl-dev git cmake perl libssl-dev libcurl4-openssl-dev protobuf-compiler libprotobuf-dev
debhelper cmake reprepro expect unzip sshpass
```

7.3.5 Build SGX

There are 3 components which need to be build for SGX

1. linux-sgx
2. linux-sgx-driver
3. sgx-ra-sample

7.3.5.1 SGX SDK

Clone and build

```
$ git clone https://github.com/intel/linux-sgx.git -b sgx_2.10
$ cd linux-sgx
$ git checkout sgx_2.10
$ ./download_prebuilt.sh
$ sudo cp external/toolset/ubuntu18.04/{as,ld,ld.gold,objdump} /usr/local/bin/
$ make -j`nproc` sdk_install_pkg DEBUG=1
```

Install SGX SDK

```
$ sudo ./linux/installer/bin//sgx_linux_x64_sdk_${version}.bin
```

where \${version} is a string something similar to 2.10.100.2.

Answer the question with no and input the install dir as /opt/intel

Build and Install SGX PSW packages

See here: <https://github.com/intel/linux-sgx#install-the-intelr-sgx-psw>

```
$ source /opt/intel/sgxsdk/environment
$ make deb_psw_pkg DEBUG=1
$ rm ./linux/installer/deb/*/*sgx-dcap-pccs*.deb
$ sudo dpkg -i ./linux/installer/deb/*/*.deb
```

Install SGX PSW packages from Intel Repository

See here: <https://github.com/intel/linux-sgx#install-the-intelr-sgx-psw-1>

Using the local repo is recommended, since the system will resolve the dependencies automatically.

Check at page no.7, https://download.01.org/intel-sgx/sgx-linux/2.9/docs/Intel_SGX_Installation_Guide_Linux_2.9_Open_Source.pdf

```
$ sudo apt install libsgx-enclave-common libsgx-epid libsgx-launch libsgx-urts libsgx-uae-service
libsgx-quote-ex
```

If you see below error,

```
Errors were encountered while processing:
/tmp/apt-dpkg-install-pCB0cR/04-libsgx-headers_2.12.100.3-bionic1_amd64.deb
```

Here is the fix

```
$ sudo apt -o Dpkg::Options::="--force-overwrite" --fix-broken install
```

7.3.5.2 Build and Install SGX Driver

See [linux-sgx-driver](#).

Caveat: Whenever updating kernel, don't forget rebuilding this driver with new version of the kernel header. (There are a few linux-sgx-driver-dkms repo, though I've experienced troubles with them.)

Clone and build

```
$ git clone https://github.com/intel/linux-sgx-driver.git
$ cd linux-sgx-driver
$ make
```

Install SGX driver

```
$ sudo mkdir -p "/lib/modules/"`uname -r`"/kernel/drivers/intel/sgx"
$ sudo cp isgx.ko "/lib/modules/"`uname -r`"/kernel/drivers/intel/sgx"
$ sudo sh -c "cat /etc/modules | grep -Fxq isgx || echo isgx » /etc/modules"
$ sudo /sbin/depmod
$ sudo /sbin/modprobe isgx
```

When modprobe fails with "Operation is not permitted", disable secure boot in BIOS. So that the unsigned kernel driver can be installed. If it is success, reboot your machine and verify `sudo lsmod | grep isgx` if it shows `isgx.ko`

7.3.6 Run sgx-ra-sample

7.3.6.1 Build sgx-ra-sample Clone and build OpenSSL 1.1.c

```
$ wget https://www.openssl.org/source/openssl-1.1.1c.tar.gz
$ tar xf openssl-1.1.1c.tar.gz
$ cd openssl-1.1.1c/
$ ./config --prefix=/opt/openssl/1.1.1c --openssldir=/opt/openssl/1.1.1c
$ make
$ sudo make install
$ cd ..
```

Clone and build sgx-ra-sample

```
$ git clone https://github.com/intel/sgx-ra-sample.git
$ cd sgx-ra-sample/
$ ./bootstrap
$ ./configure --with-openssldir=/opt/openssl/1.1.1c
$ make
```

7.3.6.2 Prepare for IAS Test

1. Obtain a subscription key for the Intel SGX Attestation Service Utilizing Enhanced Privacy ID (EPID). See here: <https://api.portal.trustedservices.intel.com/EPID-attestation>
2. Download Intel_SGX_Attestation_RootCA.pem from above portal.
3. Edit `settings` file and update the file with your own values obtained from portal.

```

7.3.6.3 Run IAS Test

Run "run-server"

[illegible]

7.3.6.6 Run LocalAttestation

Running SDK code samples in simulation mode

```
$ source /opt/intel/sgxsdk/environment
$ cd linux-sgx/SampleCode/LocalAttestation
$ make SGX_MODE=SIM
$ cd bin
$ ./app
succeed to load enclaves.
succeed to establish secure channel.
Succeed to exchange secure message...
Succeed to close Session...
```

Running in hardware mode (It works when you have latest BIOS and SGX support is enabled in BIOS)

```
$ source /opt/intel/sgxsdk/environment
$ cd linux-sgx/SampleCode/LocalAttestation
$ make SGX_MODE=HW
$ cd bin
$ ./app
succeed to load enclaves.
succeed to establish secure channel.
Succeed to exchange secure message...
Succeed to close Session...
```

7.4 Doxygen

This PDF (ta-ref.pdf) was generated using Doxygen version 1.9.2. To install doxygen-1.9.2 following procedure is necessary.

7.4.1 Required Packages

Install following packages on Ubuntu. Its better to install from package rather than using apt-install.

```
$ sudo apt install doxygen-latex graphviz texlive-full texlive-latex-base latex-cjk-all
```

Above packages required to generate PDF using doxygen.

7.4.2 Build and Install Doxygen

```
$ git clone https://github.com/doxygen/doxygen.git
$ cd doxygen
$ mkdir build
$ cd build
$ cmake -G "Unix Makefiles" ..
$ make
$ sudo make install
```

7.5 Customizing MbedTLS Configuration file

MbedTLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. MbedTLS has a configuration file `config.h` where we can select platform-specific settings, customize the features that will be build, select the modules and its configurations.

In our case, we customize mbedtls config file to add/remove crypto algorithms when building the mbedtls. The mbedtls default config supports many crypto algorithms which might be unnecessary and also increases the built binary size.

It is advisable to reduce the size of the binaries, by selecting only the required crypto algorithms for the embedded systems.

7.5.1 What can be customized?

1. how many hash algorithms to be supported
For ex: md5, sha1, sha256, sha3 or etc
2. how many symmetric algorithms to be supported
For ex: des, aes-cbc, aes-gcm or etc
3. how many asymmetric algorithms to be supported
For ex: dsa, rsa, ecdsa, eddsa or etc and their key length

7.5.2 mbedtls configuration file (config.h)

The mbedtls official way is customizing config file is by editing the `include/mbedtls/config.h` file. But in optee's build system, it require modifying `optee_os/lib/libmbedtls/include/mbedtls_config_kernel.h`

Below are the different environments mbedtls config file locations, reference file and sample config.h configurations.

7.5.2.1 Optee mbetls config file

Location of the config file in optee environment

`optee/mbedtls/include/mbedtls/config.h`

Have a look at the source which uses config.h file for reference.

Example source:

`optee/mbedtls/include/mbedtls/library/ssl_ciphersuites.c`

Some sample configurations can be found in `configs/` directory. In Optee, the contents of configs directory is listed below.

```
$ ls -l optee/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 17 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 17 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 17 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 17 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 17 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 17 2021 README.txt
```

7.5.2.2 ta-ref mbetls config file

Location of the config file in ta-ref environment

`ta-ref/teep-device/libteep/mbedtls/include/mbedtls/config.h`

Have a look at the source which uses config.h file for reference.

Example source:

`ta-ref/teep-device/libteep/mbedtls/include/mbedtls/library/ssl_ciphersuites.c`

Some sample configurations can be found in `configs/` directory. In ta-ref, the contents of configs directory is listed below.

```
$ ls -l ta-ref/teep-device/libteep/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 18 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 18 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 18 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 18 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 18 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 18 2021 README.txt
```

7.5.2.3 teep-device mbedtls config file

Location of the config file in teep-device environment

teep-device/libteep/mbedtls/include/mbedtls/config.h

Have a look at the source which uses config.h file for reference.

Example source:

teep-device/libteep/mbedtls/include/mbedtls/library/ssl_ciphersuites.c

Some sample configurations can be found in configs/ directory. In teep-device, the contents of configs directory is listed below.

```
$ ls -l teep-device/libteep/mbedtls/configs
total 24
-rw-r--r-- 1 akirat akirat 2852 Feb 18 2021 config-ccm-psk-tls1_2.h
-rw-r--r-- 1 akirat akirat 2102 Feb 18 2021 config-mini-tls1_1.h
-rw-r--r-- 1 akirat akirat 2628 Feb 18 2021 config-no-entropy.h
-rw-r--r-- 1 akirat akirat 3573 Feb 18 2021 config-suite-b.h
-rw-r--r-- 1 akirat akirat 2680 Feb 18 2021 config-thread.h
-rw-r--r-- 1 akirat akirat 1050 Feb 18 2021 README.txt
```

7.5.3 Supplement Investigation information

It is necessary to edit the following file to select the cryptographic algorithm when using mbedtls in optee.

In optee, AES-GCM is not included by default. So we need to modify the mbedtls config file to enable AES-GCM algorithm. Below is the path of the file in optee kernel where we will select the crypto algorithms.

optee/optee_os/lib/libmbedtls/include/mbedtls_config_kernel.h

Below is the path of file in TA SDK where we will select the crypto algorithms. In TA sdk, the AES-GCM is enabled by default. So any TA which uses AES-GCM should build successfully without any modification to the mbedtls config file.

optee/optee_os/lib/libmbedtls/include/mbedtls_config_uta.h

8 Building ta-ref without Docker

8.1 ta-ref with Keystone

Make sure Keystone and other dependant sources have been built

8.1.1 Cloning source and building

Install required packages

```
$ sudo apt-get update
$ sudo apt-get install -y clang-tools-6.0 libclang-6.0-dev cmake ocaml expect screen sshpass
```

Setup Env

```
$ export KEYSTONE_DIR=<path to your keystone directory>
$ export PATH=$PATH:$KEYSTONE_DIR/riscv/bin
```

Clone and Build KEYEDGE

```
$ GIT_SSL_NO_VERIFY=1 git clone --recursive https://192.168.100.100/rinkai/keyedge.git
$ cd keyedge
$ git checkout f9406aba2117147cc54462ede4766e26f028ced9
$ make
```

Clone and Build KEEDGER8R

```
$ GIT_SSL_NO_VERIFY=1 git clone --recursive https://192.168.100.100/rinkai/keedger8r.git
$ cd keedger8r
$ make
$ sed -i 's/MAX_EDGE_CALL 10$/MAX_EDGE_CALL 1000/' ${KEYSTONE_DIR}/sdk/lib/edge/include/edge_common.h
$ make -C ${KEYSTONE_DIR}/sdk/lib clean all
```

Clone the source

```
$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-device-tb-slim
$ git submodule sync --recursive
$ git submodule update --init --recursive
```

Build

```
$ export KEYSTONE_DIR=<path to keystone directory>
$ export KEYSTONE_SDK_DIR=${KEYSTONE_DIR}/sdk
$ export KEYEDGE_DIR=<path to keyedge directory>
$ export KEEDGER8R_DIR=<path to keedger8r directory>
$ source env/keystone.sh
$ make build test-bin MACHINE=HIFIVE TEST_DIR=test_hello
$ make build test-bin MACHINE=HIFIVE TEST_DIR=test_gp
```

8.1.2 Check ta-ref by running test_gp, test_hello, on QEMU

Copy the test_hello and test_gp programs to QEMU.

8.1.2.1 Launch QEMU Console

```
$ cd $KEYSTONE_DIR
$ ./scripts/run-qemu.sh
Welcome to Buildroot
```

8.1.2.2 test_hello

Run test_hello

```
$ cp test_hello/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/buildroot_overlay/root/test_hello/
$ cp test_hello/keystone/Enclave/App.client $KEYSTONE_DIR/buildroot_overlay/root/test_hello/
$ cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt $KEYSTONE_DIR/buildroot_overlay/root/test_hello/

$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt
hello world!
```

8.1.2.3 test_gp

Run test_gp

```
$ cp test_gp/keystone/Enclave/Enclave.eapp_riscv $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ cp test_gp/keystone/Enclave/App.client $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt $KEYSTONE_DIR/buildroot_overlay/root/test_gp/
$ insmod keystone-driver.ko
$ ./App.client Enclave.eapp_riscv eyrie-rt

8.4 Generating ta-ref.pdf with Doxygen

As a pre-requisite, make sure `doxygen-1.9.2` was installed and built already.

8.4.1 Cloning source and building docs

Clone the ta-ref source

```

$ git clone https://192.168.100.100/rinkai/ta-ref.git
$ cd ta-ref
$ git checkout teep-master

```

Build the documentation

```

# Export TEE Variable, TEE can be set to anything
$ export TEE=keystone
# Build the docs
$ make docs

```

After running the `make docs`, the doxygen build will be started and generates the `ta-ref.pdf` inside `docs` folder.

9 Running on Development Boards

9.1 Keystone, Unleashed

Make sure Keystone and other dependant sources have been built

9.1.1 Preparation of rootfs on SD Card

Build a modified `gdisk` which can handle the sifive specific partition types.

Prerequisites: `libncursesw5-dev`, `libpopt-dev`

```
$ cd ..
$ sudo apt install libncursesw5-dev lib64ncurses5-dev uuid-dev libpopt-dev build-essential
$ git clone https://192.168.100.100/rinkai/gptfdisk.git
$ cd gptfdisk
$ git checkout -b risc-v-sd 3d6a15873f582803aa8ad3288b3e32d3daff9fde
$ make
```

9.1.1.1 Create SD-card partition manually

```
$ sudo ./gdisk /dev/mmcblk0
GPT fdisk (gdisk) version 1.0.4
Partition table scan:
  MBR: protective
  BSD: not present
  APM: not present
  GPT: present
Found valid GPT with protective MBR; using GPT.
Command (? for help): n
Partition number (1-128, default 1): 1
First sector (34-15523806, default = 2048) or {+}size{KMGTP}:
Last sector (2048-15523806, default = 15523806) or {+}size{KMGTP}: 67583
Current type is 'Linux filesystem'
Hex code or GUID (L to show codes, Enter = 8300): 5202
Changed type of partition to 'SiFive bare-metal (or stage 2 loader)'
Command (? for help): n
Partition number (2-128, default 2): 4
First sector (34-15523806, default = 67584) or {+}size{KMGTP}:
Last sector (67584-15523806, default = 15523806) or {+}size{KMGTP}: 67839
Current type is 'Linux filesystem'
Hex code or GUID (L to show codes, Enter = 8300): 5201
Changed type of partition to 'SiFive FSBL (first-stage bootloader)'
Command (? for help): n
Partition number (2-128, default 2):
First sector (34-15523806, default = 69632) or {+}size{KMGTP}: 264192
Last sector (264192-15523806, default = 15523806) or {+}size{KMGTP}:
Current type is 'Linux filesystem'
Hex code or GUID (L to show codes, Enter = 8300): 8300
Changed type of partition to 'Linux filesystem'
Command (? for help): p
Disk /dev/mmcblk0: 15523840 sectors, 7.4 GiB
Sector size (logical/physical): 512/512 bytes
Disk identifier (GUID): 11A0F8F6-D5DE-4993-8C0D-D543DFBA17AD
Partition table holds up to 128 entries
Main partition table begins at sector 2 and ends at sector 33
First usable sector is 34, last usable sector is 15523806
Partitions will be aligned on 2048-sector boundaries
Total free space is 198366 sectors (96.9 MiB)

Number Start (sector) End (sector) Size Code Name

Partition size: 65536 sectors (32.0 MiB)
Attribute flags: 0000000000000000
Partition name: 'SiFive bare-metal (or stage 2 loader)'
Command (? for help): wq
Final checks complete. About to write GPT data. THIS WILL OVERWRITE EXISTING
PARTITIONS!!
Do you want to proceed? (Y/N): y
OK; writing new GUID partition table (GPT) to /dev/mmcblk1.
Warning: The kernel is still using the old partition table.
The new table will be used at the next reboot or after you
run partprobe(8) or kpartx(8)
The operation has completed successfully.
```

9.1.1.2 Write boot and rootfs files into SD-card

Build FSBL for hifive-Unleashed board

```
$ git clone https://github.com/keystone-enclave/freedom-u540-c000-bootloader.git
$ cd freedom-u540-c000-bootloader
$ git checkout -b dev-unleashed bbfcc288fb438312af51adef420aa444a0833452
$ # Make sure riscv64 compiler set to PATH (export PATH=$KEYSTONE_DIR/riscv/bin:$PATH)
$ make
```

Writing fsbl.bin and bbl.bin

```
$ sudo dd if=freedom-u540-c000-bootloader/fsbl.bin of=/dev/mmcblk0p4 bs=4096 conv=fsync
$ sudo dd if=$KEYSTONE_DIR/hifive-work/bbl.bin of=/dev/mmcblk0p1 bs=4096 conv=fsync
```

Once files written, insert the SD-card into unleashed

9.1.2 Copying binaries of test_hello and test_gp

```
$ sudo mount /dev/mmcblk0p1 /media/rootfs/
$ sudo mkdir /media/rootfs/root/{test_hello,test_gp}
```

Copy test_hello

```
$ sudo cp ta-ref/test_hello/keystone/Enclave/Enclave.eapp_riscv /media/rootfs/root/test_hello/
$ sudo cp ta-ref/test_hello/keystone/Enclave/App.client /media/rootfs/root/test_hello/
$ sudo cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt /media/rootfs/root/test_hello/
```

Copy test_gp

```
$ sudo cp ta-ref/test_gp/keystone/Enclave/Enclave.eapp_riscv /media/rootfs/root/test_gp/
$ sudo cp ta-ref/test_gp/keystone/Enclave/App.client /media/rootfs/root/test_gp/
$ sudo cp $KEYSTONE_SDK_DIR/rts/eyrie/eyrie-rt /media/rootfs/root/test_gp/
```

Now, we are ready to test on unleashed board.

9.1.3 Check test_hello and test_gp on Unleashed

1. Insert SD-card into unleashed board
2. Boot Hifive-Unleashed board
3. Connect Unleashed board with your development machine over USB-Serial cable (/dev/ttyUSB1)
4. Checking on Unleashed
Login to serial console with user=root, passwd=sifive

```
buildroot login: root
Password:
$
```

test_hello:

```
$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt
hello world!
```

test_gp:

```

$ insmod keystone-driver.ko
./App.client Enclave.eapp_riscv eyrie-rt

Test is successful.

9.2 OP-TEE, RPI3

Make sure OP-TEE v3.9.0 and other dependant sources have been built

9.2.1 Preparation of rootfs on SD Card

Use following examples to create partitions of boot and rootfs on SD-card

```

$ make img-help
$ fdisk /dev/sdx      # where sdx is the name of your sd-card
> p                  # prints partition table
> d                  # repeat until all partitions are deleted
> n                  # create a new partition
> p                  # create primary
> 1                  # make it the first partition
> <enter>            # use the default sector
> +32M               # create a boot partition with 32MB of space
> n                  # create rootfs partition
> p
> 2
> <enter>
> <enter>            # fill the remaining disk, adjust size to fit your needs
> t                  # change partition type
> 1                  # select first partition
> e                  # use type 'e' (FAT16)
> a                  # make partition bootable
> 1                  # select first partition
> p                  # double check everything looks right
> w                  # write partition table to disk.

```

Usually your SD-card detected as `/dev/mmcblk0`. After partition it looks like below BOOT partition = `/dev/mmcblk0p1` rootfs partition = `/dev/mmcblk0p2`

Write boot file

```

$ mkfs.vfat -F16 -n BOOT /dev/mmcblk0p1
$ mkdir -p /media/boot
$ sudo mount /dev/mmcblk0p1 /media/boot
$ cd /media
$ gunzip -cd optee_3.9.0_rpi3/out-br/images/rootfs.cpio.gz | sudo cpio -idmv "boot/*"
$ umount boot

```

Write rootfs

```

$ mkfs.ext4 -L rootfs /dev/mmcblk0p2
$ mkdir -p /media/rootfs
$ sudo mount /dev/mmcblk0p2 /media/rootfs
$ cd rootfs
$ gunzip -cd <your-base-dir>/optee_3.9.0_rpi3/build/./out-br/images/rootfs.cpio.gz | sudo cpio
-idmv
$ rm -rf /media/rootfs/boot/*
$ cd .. && sudo umount rootfs

```

If you use CI from AIST, download `rpi3_sdimage` as follows

```
$ wget http://192.168.100.100:2000/optee_rpi3_sdimage.tar.xz
$ tar xf optee_rpi3_sdimage.tar.xz
$ dd if=rpi3_sdimage.bin of=/dev/mmcblk0p2 conv=fsync bs=4096
```

Now SD-card is ready to boot RPI3.

9.2.2 Copying binaries of test_hello and test_gp to rootfs partition

Copying test_hello & test_gp

```
$ sudo mount /dev/mmcblk0p2 /media/rootfs
$ sudo mkdir -p /media/rootfs/home/gitlab/out/{test_hello,test_gp}
$ sudo cp ta-ref/test_hello/optee/App/optee_ref_ta /media/rootfs/home/gitlab/out/test_hello/
$ sudo cp ta-ref/test_hello/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/media/rootfs/home/gitlab/out/test_hello/
$ sudo cp ta-ref/test_gp/optee/App/optee_ref_ta /media/rootfs/home/gitlab/out/test_gp/
$ sudo cp ta-ref/test_gp/optee/Enclave/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/media/rootfs/home/gitlab/out/test_gp/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ sudo cp ta-ref/test_gp/optee/Enclave/Enclave.nm /media/rootfs/home/gitlab/out/test_gp/
```

9.2.3 Check test_hello and test_gp

1. Insert SD-card into RPI3 board, then power-on
2. Connect RPI3 board Serial console to your laptop (/dev/ttyUSB0 over minicom)
3. Checking on RPI3

Login to Serial console and enter "root" as username

```
buildroot login: root
Password:
$
```

test_hello:

```
$ cp /home/gitlab/out/test_hello/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
--- enclave log start---
ecall_ta_main() start
hello world!
ecall_ta_main() end
--- enclave log end---
```

If executed successfully, you see above messages

test_gp:

```
$ cd /home/gitlab/out/test_gp/
$ cp a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta /home/gitlab/out/
$ ln -s /home/gitlab/out/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
/lib64/optee_armtz/a6f77c1e-96fe-4a0e-9e74-262582a4c8f1.ta
$ ./optee_ref_ta
start TEEC_InvokeCommand
--- enclave log start---
ecall_ta_main() start
```

```

9.3 SGX, NUC

Make sure SGX SDK, sgx driver and other dependant sources have been built and installed on NUC machine

9.3.1 Copying binaries of test_hello and test_gp to NUC machine

Login to NUC machine over SSH (Assuming that SSH enabled on NIC machine). Assuming that ta-ref was natively built on NUC machine at ~/ta-ref

```

$ ssh <ssh-user>@<IP-Address> 'mkdir -p ~/test_hello,test_gp'
$ scp ta-ref/test_hello/sgx/Enclave/enclave.signed.so <ssh-user>@<IP-Address>:~/test_hello
$ scp ta-ref/test_hello/sgx/App/sgx_app <ssh-user>@<IP-Address>:~/test_hello
$ scp ta-ref/test_gp/sgx/Enclave/enclave.signed.so <ssh-user>@<IP-Address>:~/test_gp
$ scp ta-ref/test_gp/sgx/App/sgx_app <ssh-user>@<IP-Address>:~/test_gp

```

Now can login to NUC machine for further testing.

9.3.2 Check test_hello and test_gp

Checking test_hello

```
$ cd ~/test_hello
$ ./sgx_app
hello world!
Info: Enclave successfully returned.
```

Checking test_gp

```
$ cd ~/test_gp
$ ./sgx_app

- [TEEC_Parameter](#) [params](#) [TEEC_CONFIG_PAYLOAD_REF_COUNT]
- [TEEC_Session](#) * [session](#)

12.22.1 Detailed Description

struct [TEEC_Operation](#) - Holds information and memory references used in [TEEC_InvokeCommand\(\)](#).

Parameters

<i>started</i>	Client must initialize to zero if it needs to cancel an operation about to be performed.
<i>paramTypes</i>	Type of data passed. Use TEEC_PARAMS_TYPE macro to create the correct flags. 0 means TEEC_NONE is passed for all params.
<i>params</i>	Array of parameters of type TEEC_Parameter .
<i>session</i>	Internal pointer to the last session used by TEEC_InvokeCommand with this operation.

Collaboration diagram for TEEC_Parameter:

Public Attributes

- [TEEC_TempMemoryReference tmpref](#)
- [TEEC_RegisteredMemoryReference memref](#)
- [TEEC_Value value](#)

12.23.1 Detailed Description

union [TEEC_Parameter](#) - Memory container to be used when passing data between client application and trusted code.

Either the client uses a shared memory reference, parts of it or a small raw data container.

Parameters

<i>tmpref</i>	A temporary memory reference only valid for the duration of the operation.
<i>memref</i>	The entire shared memory or parts of it.
<i>value</i>	The small raw data container to use

12.23.2 Member Data Documentation

12.23.2.1 memref [TEEC_RegisteredMemoryReference](#) `TEEC_Parameter::memref`

Collaboration diagram for TEEC_RegisteredMemoryReference:

Public Attributes

- [TEEC_SharedMemory](#) * `parent`
- `size_t` `size`
- `size_t` `offset`

12.24.1 Detailed Description

struct [TEEC_RegisteredMemoryReference](#) - use a pre-registered or pre-allocated shared memory block of memory to transfer data between a client application and trusted code.

Parameters

<i>parent</i>	Points to a shared memory structure. The memory reference may utilize the whole shared memory or only a part of it. Must not be NULL
<i>size</i>	The size, in bytes, of the memory buffer.
<i>offset</i>	The offset, in bytes, of the referenced memory region from the start of the shared memory block.

12.24.2 Member Data Documentation

12.24.2.1 offset `size_t TEEC_RegisteredMemoryReference::offset`

12.24.2.2 parent `TEEC_SharedMemory* TEEC_RegisteredMemoryReference::parent`

- int [id](#)
- size_t [allocated_size](#)
- void * [shadow_buffer](#)
- int [registered_fd](#)
- bool [buffer_allocated](#)

12.26.1 Detailed Description

struct [TEEC_SharedMemory](#) - Memory to transfer data between a client application and trusted code.

Parameters

<i>buffer</i>	The memory buffer which is to be, or has been, shared with the TEE.
<i>size</i>	The size, in bytes, of the memory buffer.
<i>flags</i>	Bit-vector which holds properties of buffer. The bit-vector can contain either or both of the TEEC_MEM_INPUT and TEEC_MEM_OUTPUT flags.

A shared memory block is a region of memory allocated in the context of the client application memory space that can be used to transfer data between that client application and a trusted application. The user of this struct is responsible to populate the buffer pointer.

12.26.2 Member Data Documentation

12.26.2.1 [allocated_size](#) `size_t TEEC_SharedMemory::allocated_size`

12.26.2.5 id `int TEEC_SharedMemory::id`

12.26.2.6 registered_fd `int TEEC_SharedMemory::registered_fd`

12.26.2.7 shadow_buffer `void* TEEC_SharedMemory::shadow_buffer`

12.26.2.8 size `size_t TEEC_SharedMemory::size`

The documentation for this struct was generated from the following file:

- [ta-ref/api/include/tee_client_api.h](#)

12.27 TEEC_TempMemoryReference Struct Reference

```
#include <tee_client_api.h>
```

Public Attributes

- `void *` [buffer](#)
- `size_t` [size](#)

12.27.1 Detailed Description

struct [TEEC_TempMemoryReference](#) - Temporary memory to transfer data between a client application and trusted code, only used for the duration of the operation.

Parameters

<i>buffer</i>	The memory buffer which is to be, or has been shared with the TEE.
<i>size</i>	The size, in bytes, of the memory buffer.

A memory buffer that is registered temporarily for the duration of the operation to be called.

12.27.2 Member Data Documentation

12.27.2.1 buffer void* TEEC_TempMemoryReference::buffer

12.27.2.2 size size_t TEEC_TempMemoryReference::size

The documentation for this struct was generated from the following file:

- ta-ref/api/include/[tee_client_api.h](#)

12.28 TEEC_UUID Struct Reference

```
#include <tee_client_api.h>
```

Public Attributes

- uint32_t [timeLow](#)
- uint16_t [timeMid](#)
- uint16_t [timeHiAndVersion](#)
- uint8_t [clockSeqAndNode](#) [8]

12.28.1 Detailed Description

This type contains a Universally Unique Resource Identifier (UUID) type as defined in RFC4122. These UUID values are used to identify Trusted Applications.

12.28.2 Member Data Documentation

12.28.2.1 clockSeqAndNode uint8_t TEEC_UUID::clockSeqAndNode[8]

12.28.2.2 timeHiAndVersion uint16_t TEEC_UUID::timeHiAndVersion

12.28.2.3 timeLow uint32_t TEEC_UUID::timeLow

12.28.2.4 timeMid `uint16_t TEEC_UUID::timeMid`

The documentation for this struct was generated from the following file:

- [ta-ref/api/include/tee_client_api.h](#)

12.29 TEEC_Value Struct Reference

```
#include <tee_client_api.h>
```

Public Attributes

- `uint32_t a`
- `uint32_t b`

12.29.1 Detailed Description

struct [TEEC_Value](#) - Small raw data container

Instead of allocating a shared memory buffer this structure can be used to pass small raw data between a client application and trusted code.

Parameters

<i>a</i>	The first integer value.
<i>b</i>	The second second value.

12.29.2 Member Data Documentation**12.29.2.1 a** `uint32_t TEEC_Value::a`**12.29.2.2 b** `uint32_t TEEC_Value::b`

The documentation for this struct was generated from the following file:

- [ta-ref/api/include/tee_client_api.h](#)

122  * Dealing with detecting overflow in multiplication of integers.
123  * First step is to remove two corner cases with the minum signed integer
124  * which can't be represented as a positive integer + sign.
125  * Multiply with 0 or 1 can't overflow, no checking needed of the operation,
126  * only if it can be assigned to the result.
127  * After the corner cases are eliminated we convert the two factors to
128  * positive unsigned values, keeping track of the original in another
129  * variable which is used at the end to determine the sign of the product.
130  */

```

```

134 * The two terms (a and b) are divided into upper and lower half (x1 upper
135 * and x0 lower), so the product is:
136 * ((a1 << hshift) + a0) * ((b1 << hshift) + b0)
137 * which also is:
138 * ((a1 * b1) << (hshift * 2)) +          (T1)
139 * ((a1 * b0 + a0 * b1) << hshift) +      (T2)
140 * (a0 * b0)                             (T3)
141 *
142 * From this we can tell and (a1 * b1) has to be 0 or we'll overflow, that
143 * is, at least one of a1 or b1 has to be 0. Once this has been checked the
144 * addition: ((a1 * b0) << hshift) + ((a0 * b1) << hshift)
145 * isn't an addition as one of the terms will be 0.
146 *
147 * Since each factor in: (a0 * b0)
148 * only uses half the capacity of the underlaying type it can't overflow
149 *
150 * The addition of T2 and T3 can overflow so we use __INTOF_ADD() to
151 * perform that addition. If the addition succeeds without overflow the
152 * result is assigned the required sign and checked for overflow again.
153 */

- void **TEE_FreeTransientObject** (**TEE_ObjectHandle** object)
Crypto, Asymmetric key Verification Functions.
- **TEE_Result TEE_AsymmetricSignDigest** (**TEE_OperationHandle** operation, const **TEE_Attribute** *params, uint32_t paramCount, const void *digest, uint32_t digestLen, void *signature, uint32_t *signatureLen)
Crypto, Asymmetric key Verification Functions.
- **TEE_Result TEE_AsymmetricVerifyDigest** (**TEE_OperationHandle** operation, const **TEE_Attribute** *params, uint32_t paramCount, const void *digest, uint32_t digestLen, const void *signature, uint32_t signatureLen)
Crypto, Asymmetric key Verification Functions.

13.7.1 Detailed Description

Candidate API list for Global Platform like RISC-V TEE.

draft RISC-V Internal TEE API

Author

Akira Tsukamoto, AIST

Date

2019/09/25

13.7.2 Function Documentation

13.7.2.1 `__attribute__((noret)) void __attribute__((noret))`

[TEE_Panic\(\)](#) - Raises a panic in the Trusted Application instance.

When a Trusted Application calls the TEE_Panic function, the current instance shall be destroyed and all the resources opened by the instance shall be reclaimed. All sessions opened from the panicking instance on another TA shall be gracefully closed and all cryptographic objects and operations shall be closed properly.

Parameters

<i>code</i>	An informative panic code defined by the TA.
-------------	--

Returns

panic code will be returned.

[TEE_Panic\(\)](#) - Raises a Panic in the Trusted Application instance

When a Trusted Application calls the TEE_Panic function, the current instance shall be destroyed and all the resources opened by the instance shall be reclaimed.

Parameters

<i>ec</i>	An informative panic code defined by the TA. May be displayed in traces if traces are available.
-----------	--

13.7.2.2 `GetRelTimeEnd() TEE_Result GetRelTimeEnd (`

```
uint64_t end )
```

Core Functions, Time Functions.

Return the elapsed.

[GetRelTimeEnd\(\)](#) - finds the real time of the end timing.

This function prints the ending time.

Parameters

<i>end</i>	End timing
------------	------------

Returns

0 If success

[GetRelTimeStart\(\)](#) - find the real time of the end timing.

This function prints the End timing.

Parameters

<i>end</i>	End timing
------------	------------

Returns

0 if success else error occurred

13.7.2.3 GetRelTimeStart() `TEE_Result GetRelTimeStart (`
`uint64_t start)`

Core Functions, Time Functions.

Fast relative Time function which guarantees no hart switch or context switch between Trusted and Untrusted sides.

Most of the time ending up writing similar functions when only measuring the relative time in usec resolution which do not require the quality of the time itself but the distance of the two points.

For the usage above, the function does not have to return wall clock time.

Not prepared in both Keystone and GP.

[GetRelTimeStart\(\)](#) - Gets the real time of the start timing.

This function prints the starting time.

Parameters

<i>start</i>	Start timing
--------------	--------------

Returns

0 on success

[GetRelTimeStart\(\)](#) - Gets the real time of the start timing.

This function prints the start timing.

Parameters

<i>start</i>	start timing
--------------	--------------

Returns

0 if success else error occurred.

13.7.2.4 TEE_AEDecryptFinal() `TEE_Result TEE_AEDecryptFinal (TEE_OperationHandle operation, const void * srcData, uint32_t srcLen, void * destData, uint32_t * destLen, void * tag, uint32_t tagLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CCM, TEE_ALG_AES_GCM.

[TEE_AEDecryptFinal\(\)](#) - Processes data that has not been processed by previous calls to TEE_AEUpdate as well as data supplied in srcData.

This function completes the AE operation and compares the computed tag with the tag supplied in the parameter tag. The operation handle can be reused or newly initialized. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag.
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output

TEE_ERROR_MAC_INVALID If the computed tag does not match the supplied tag

13.7.2.5 TEE_AEEncryptFinal() `TEE_Result TEE_AEEncryptFinal (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen,`
`void * tag,`
`uint32_t * tagLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CCM, TEE_ALG_AES_GCM.

[TEE_AEEncryptFinal\(\)](#) - processes data that has not been processed by previous calls to TEE_AEUpdate as well as data supplied in srcData .

TEE_AEEncryptFinal completes the AE operation and computes the tag. The operation handle can be reused or newly initialized. The buffers srcData and destData SHALL be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output or tag buffer is not large enough to contain the output.

13.7.2.6 TEE_AEInit() `TEE_Result TEE_AEInit (`
`TEE_OperationHandle operation,`
`const void * nonce,`
`uint32_t nonceLen,`
`uint32_t tagLen,`

```
uint32_t AADLen,
uint32_t payloadLen )
```

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CCM, TEE_ALG_AES_GCM.

[TEE_AEInit\(\)](#) - Initializes an Authentication Encryption operation.

The operation must be in initial state and remains in the initial state afterwards.

Parameters

<i>operation</i>	A handle on the operation.
<i>nonce</i>	The operation nonce or IV
<i>nonceLen</i>	length of nonce
<i>tagLen</i>	Size in bits of the tag
<i>AADLen</i>	Length in bytes of the AAD
<i>payloadLen</i>	Length in bytes of the payload.

Returns

0 on success.

TEE_ERROR_NOT_SUPPORTED If the tag length is not supported by the algorithm.

13.7.2.7 TEE_AEUpdate() [TEE_Result](#) TEE_AEUpdate (
[TEE_OperationHandle](#) operation,
const void * srcData,
uint32_t srcLen,
void * destData,
uint32_t * destLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CCM, TEE_ALG_AES_GCM.

[TEE_AEUpdate\(\)](#) - Accumulates data for an Authentication Encryption operation

This function describes Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. when using this routine to decrypt the returned data may be corrupt since the integrity check is not performed until all the data has been processed. If this is a concern then only use the TEE_AEDecryptFinal routine.

Parameters

<i>operation</i>	Handle of a running AE operation.
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of the input buffer.
<i>destData</i>	Output buffer
<i>destLen</i>	length of the out put buffer.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER if the output buffer is not large enough to contain the output.

13.7.2.8 TEE_AEUpdateAAD() void TEE_AEUpdateAAD (
 TEE_OperationHandle operation,
 const void * AADdata,
 uint32_t AADdataLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CCM, TEE_ALG_AES_GCM.

[TEE_AEUpdateAAD\(\)](#) - Feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible.

The TEE_AEUpdateAAD function feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation SHALL be in initial state and remains in initial state afterwards.

Parameters

<i>operation</i>	Handle on the AE operation
<i>AADdata</i>	Input buffer containing the chunk of AAD
<i>AADdataLen</i>	length of the chunk of AAD.

13.7.2.9 TEE_AllocateOperation() TEE_Result TEE_AllocateOperation (
 TEE_OperationHandle * operation,
 uint32_t algorithm,
 uint32_t mode,
 uint32_t maxKeySize)

Crypto, for all Crypto Functions.

All Crypto Functions use TEE_OperationHandle* operation instances.
Create Crypto instance.

[TEE_AllocateOperation\(\)](#) - Allocates a handle for a new cryptographic operation and sets the mode and algorithm type.

If this function does not return with TEE_SUCCESS then there is no valid handle value. Once a cryptographic operation has been created, the implementation shall guarantee that all resources necessary for the operation are allocated and that any operation with a key of at most maxKeySize bits can be performed. For algorithms that take multiple keys, for example the AES XTS algorithm, the maxKeySize parameter specifies the size of the largest key. It is up to the implementation to properly allocate space for multiple keys if the algorithm so requires.

Parameters

<i>operation</i>	reference to generated operation handle.
<i>algorithm</i>	One of the cipher algorithms.
<i>mode</i>	The operation mode.
<i>maxKeySize</i>	Maximum key size in bits for the operation.

Returns

0 in case of success

TEE_ERROR_OUT_OF_MEMORY If there are not enough resources to allocate the operation.

TEE_ERROR_NOT_SUPPORTED If the mode is not compatible with the algorithm or key size or if the algorithm is not one of the listed algorithms or if maxKeySize is not appropriate for the algorithm.

13.7.2.10 TEE_AllocateTransientObject() `TEE_Result TEE_AllocateTransientObject (`
`TEE_ObjectType objectType,`
`uint32_t maxKeySize,`
`TEE_ObjectHandle * object)`

Crypto, Asymmetric key Verification Functions.

Create object storing asymmetric key.

TEE_AllocateTransientObject() - Allocates an uninitialized transient object. Transient objects are used to hold a cryptographic object (key or key-pair).

The value TEE_KEYSIZE_NO_KEY should be used for maxObjectSize for object types that do not require a key so that all the container resources can be pre-allocated. As allocated, the container is uninitialized. It can be initialized by subsequently importing the object material, generating an object, deriving an object, or loading an object from the Trusted Storage.

Parameters

<i>objectType</i>	Type of uninitialized object container to be created
<i>maxKeySize</i>	Key Size of the object.
<i>object</i>	Filled with a handle on the newly created key container.

Returns

0 on success

TEE_ERROR_OUT_OF_MEMORY If not enough resources are available to allocate the object handle.

TEE_ERROR_NOT_SUPPORTED If the key size is not supported or the object type is not supported.

13.7.2.11 TEE_AsymmetricSignDigest() `TEE_Result TEE_AsymmetricSignDigest (`
`TEE_OperationHandle operation,`
`const TEE_Attribute * params,`
`uint32_t paramCount,`
`const void * digest,`
`uint32_t digestLen,`
`void * signature,`
`uint32_t * signatureLen)`

Crypto, Asymmetric key Verification Functions.

Sign a message digest within an asymmetric key operation.

Keystone has `ed25519_sign()`.

Equivalent in openssl is `EVP_DigestSign()`.

[TEE_AsymmetricSignDigest\(\)](#) - Signs a message digest within an asymmetric operation.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

0 on success

`TEE_ERROR_SHORT_BUFFER` If the signature buffer is not large enough to hold the result

13.7.2.12 TEE_AsymmetricVerifyDigest() `TEE_Result TEE_AsymmetricVerifyDigest (`
`TEE_OperationHandle operation,`
`const TEE_Attribute * params,`
`uint32_t paramCount,`
`const void * digest,`
`uint32_t digestLen,`
`const void * signature,`
`uint32_t signatureLen)`

Crypto, Asymmetric key Verification Functions.

Verifies a message digest signature within an asymmetric key operation.

Keystone has `ed25519_verify()`.

Equivalent in openssl is `EVP_DigestVerify()`.

[TEE_AsymmetricVerifyDigest\(\)](#) - verifies a message digest signature within an asymmetric operation.

This function describes the message digest signature verify by calling `ed25519_verify()`.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param.
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

TEE_SUCCESS on success

TEE_ERROR_SIGNATURE_INVALID if the signature is invalid.

13.7.2.13 TEE_CipherInit() void TEE_CipherInit (
 TEE_OperationHandle operation,
 const void * nonce,
 uint32_t nonceLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CBC.

TEE_CipherInit() - starts the symmetric cipher operation.

The operation shall have been associated with a key. If the operation is in active state, it is reset and then initialized. If the operation is in initial state, it is moved to active state.

Parameters

<i>operation</i>	A handle on an opened cipher operation setup with a key
<i>nonce</i>	Buffer containing the operation Initialization Vector as appropriate.
<i>nonceLen</i>	length of the buffer

13.7.2.14 TEE_CipherUpdate() TEE_Result TEE_CipherUpdate (
 TEE_OperationHandle operation,
 const void * srcData,
 uint32_t srcLen,
 void * destData,
 uint32_t * destLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Supports TEE_ALG_AES_CBC.

[TEE_CipherUpdate\(\)](#) - encrypts or decrypts input data.

Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. The cipher operation is finalized with a call to `TEE_CipherDoFinal`. The buffers `srcData` and `destData` SHALL be either completely disjoint or equal in their starting positions. The operation SHALL be in active state.

Parameters

<i>operation</i>	Handle of a running Cipher operation
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of input buffer
<i>destData</i>	output buffer
<i>destLen</i>	output buffer length.

Returns

0 on success else

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output. In this case, the input is not fed into the algorithm.

13.7.2.15 TEE_CloseObject() `void TEE_CloseObject (`
 `TEE_ObjectHandle object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Destroy object (key, key-pair or Data).

[TEE_CloseObject\(\)](#) - Closes an opened object handle.

The object can be persistent or transient. For transient objects, `TEE_CloseObject` is equivalent to `TEE_FreeTransientObject`.

Parameters

<i>object</i>	Handle of the object.
---------------	-----------------------

Returns

TEE_SUCCESS if success else error occurred.

[TEE_CloseObject\(\)](#) - Function closes an opened object handle.

The object can be persistent or transient. For transient objects, `TEE_CloseObject` is equivalent to `TEE_FreeTransientObject`.

Parameters

<i>object</i>	Handle of the object
---------------	----------------------

Returns

TEE_SUCCESS if success else error occurred.

13.7.2.16 TEE_CreatePersistentObject() `TEE_Result TEE_CreatePersistentObject (`
`uint32_t storageID,`
`const void * objectID,`
`uint32_t objectIDLen,`
`uint32_t flags,`
`TEE_ObjectHandle attributes,`
`const void * initialData,`
`uint32_t initialDataLen,`
`TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Create persistent object (key, key-pair or Data).

For the people who have not written code on GP then probably do not need to care the meaning of what is Persistent Object is, since the following are enough to use secure storage feature.

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

In this function an initial data stream content returns either a handle on the created object or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

An initial data stream content, and optionally returns either a handle on the created object, or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.7.2.17 TEE_DigestDoFinal() `TEE_Result TEE_DigestDoFinal (`
`TEE_OperationHandle operation,`
`const void * chunk,`
`uint32_t chunkLen,`
`void * hash,`
`uint32_t * hashLen)`

Function accumulates message data for hashing.

TEE_DigestDoFinal() - Finalizes the message digest operation and produces the message hash.

This function finalizes the message digest operation and produces the message hash. Afterwards the Message Digest operation is reset to initial state and can be reused.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed.
<i>chunkLen</i>	size of the chunk.
<i>hash</i>	Output buffer filled with the message hash.
<i>hashLen</i>	length of the message hash.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the output buffer is too small. In this case, the operation is not finalized.

13.7.2.18 TEE_DigestUpdate() `void TEE_DigestUpdate (`
 `TEE_OperationHandle operation,`
 `const void * chunk,`
 `uint32_t chunkSize)`

Crypto, Message Digest Functions.

Function accumulates message data for hashing.

[TEE_DigestUpdate\(\)](#) - Accumulates message data for hashing.

This function describes the message does not have to be block aligned. Subsequent calls to this function are possible. The operation may be in either initial or active state and becomes active.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed
<i>chunkSize</i>	size of the chunk.

13.7.2.19 TEE_FreeOperation() `void TEE_FreeOperation (`
 `TEE_OperationHandle operation)`

Crypto, for all Crypto Functions.

All Crypto Functions use `TEE_OperationHandle*` operation instances.
Destroy Crypto instance.

[TEE_FreeOperation\(\)](#) - Deallocates all resources associated with an operation handle.

This function deallocates all resources associated with an operation handle. After this function is called, the operation handle is no longer valid. All cryptographic material in the operation is destroyed. The function does nothing if operation is `TEE_HANDLE_NULL`.

Parameters

<i>operation</i>	Reference to operation handle.
------------------	--------------------------------

Returns

nothing after the operation free.

13.7.2.20 TEE_FreeTransientObject() `void TEE_FreeTransientObject (`
 `TEE_ObjectHandle object)`

Crypto, Asymmetric key Verification Functions.

Destroy object storing asymmetric key.

[TEE_FreeTransientObject\(\)](#) - Deallocates a transient object previously allocated with [TEE_AllocateTransientObject](#)

this function describes the object handle is no longer valid and all resources associated with the transient object shall have been reclaimed after the [TEE_AllocateTransientObject\(\)](#) call.

Parameters

<i>object</i>	Handle on the object to free.
---------------	-------------------------------

13.7.2.21 TEE_GenerateKey() `TEE_Result TEE_GenerateKey (`
`TEE_ObjectHandle object,`
`uint32_t keySize,`
`const TEE_Attribute * params,`
`uint32_t paramCount)`

Crypto, Asymmetric key Verification Functions.

Generate asymmetric keypair.

[TEE_GenerateKey\(\)](#) - Generates a random key or a key-pair and populates a transient key object with the generated key material.

The size of the desired key is passed in the keySize parameter and shall be less than or equal to the maximum key size specified when the transient object was created.

Parameters

<i>object</i>	Handle on an uninitialized transient key to populate with the generated key.
<i>keySize</i>	Requested key size shall be less than or equal to the maximum key size specified when the object container was created
<i>params</i>	Parameters for the key generation.
<i>paramCount</i>	The values of all parameters are copied into the object so that the params array and all the memory buffers it points to may be freed after this routine returns without affecting the object.

Returns

0 on succes

[TEE_ERROR_BAD_PARAMETERS](#) If an incorrect or inconsistent attribute is detected. The checks that are performed depend on the implementation.

13.7.2.22 TEE_GenerateRandom() `void TEE_GenerateRandom (`
 `void * randomBuffer,`
 `uint32_t randomBufferLen)`

Crypto, common.

Random Data Generation Function. The quality of the random is implementation dependent.
I am not sure this should be in Keystone or not, but it is very handy.
Good to have adding a way to check the quality of the random implementation.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random buffer length and is stored in to random Buffer by calling `wc_↵ RNG_GenerateBlock()`. If ret is not equal to 0 then `TEE_Panic` is called.

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

Returns

random data random data will be returned.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random bufferlength and is stored in to randomBuffer by calling `sgx_read_↵ _rand()`.

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

13.7.2.23 TEE_GetObjectInfo1() `TEE_Result TEE_GetObjectInfo1 (`
 `TEE_ObjectHandle object,`
 `TEE_ObjectInfo * objectInfo)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Get length of object required before reading the object.

[TEE_GetObjectInfo1\(\)](#) - Returns the characteristics of an object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

[TEE_GetObjectInfo1\(\)](#) - Function returns the characteristics of an object.

It returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

13.7.2.24 TEE_GetREETime() `void TEE_GetREETime (`
`TEE_Time * time)`

Core Functions, Time Functions.

Wall clock time of host OS, expressed in the number of seconds since 1970-01-01 UTC.
This could be implemented on Keystone using ocall.

[TEE_GetREETime\(\)](#) - Retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

[TEE_GetREETime\(\)](#) - Function retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.7.2.25 TEE_GetSystemTime() `void TEE_GetSystemTime (`
`TEE_Time * time)`

Core Functions, Time Functions.

Time of TEE-controlled secure timer or Host OS time, implementation dependent.

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

This function describes the system time has an arbitrary implementation defined origin that can vary across TA instances. The minimum guarantee is that the system time shall be monotonic for a given TA instance.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

The system time has an arbitrary implementation-defined origin that can vary across TA instances

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.7.2.26 TEE_InitRefAttribute() `void TEE_InitRefAttribute (`
`TEE_Attribute * attr,`
`uint32_t attributeID,`
`const void * buffer,`
`uint32_t length)`

Crypto, Asymmetric key Verification Functions.

Storing asymmetric key.

[TEE_InitRefAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

In `TEE_InitRefAttribute ()` only the buffer pointer is copied, not the content of the buffer. This means that the attribute structure maintains a pointer back to the supplied buffer. It is the responsibility of the TA author to ensure that the contents of the buffer maintain their value until the attributes array is no longer in use.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>buffer</i>	input buffer that holds the content of the attribute.
<i>length</i>	buffer length.

13.7.2.27 TEE_InitValueAttribute() `void TEE_InitValueAttribute (`
 `TEE_Attribute * attr,`
 `uint32_t attributeID,`
 `uint32_t a,`
 `uint32_t b)`

Crypto, Asymmetric key Verification Functions.

Storing asymmetric key.

[TEE_InitValueAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>a</i>	unsigned integer value to assign to the a member of the attribute structure.
<i>b</i>	unsigned integer value to assign to the b member of the attribute structure

13.7.2.28 TEE_OpenPersistentObject() `TEE_Result TEE_OpenPersistentObject (`
 `uint32_t storageID,`
 `const void * objectID,`
 `uint32_t objectIDLen,`
 `uint32_t flags,`
 `TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Open persistent object.

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.7.2.29 TEE_ReadObjectData() `TEE_Result TEE_ReadObjectData (`
 `TEE_ObjectHandle object,`
 `void * buffer,`
 `uint32_t size,`
 `uint32_t * count)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Read object.

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion of TEE_ReadObjectData sets the number of bytes actually read in the "uint32_t" pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-3067 stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success else error occurred.

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion TEE_ReadObjectData sets the number of bytes actually read in the uint32_t pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-3067 stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success, else error occurred.

13.7.2.30 TEE_SetOperationKey() [TEE_Result](#) TEE_SetOperationKey (
[TEE_OperationHandle](#) operation,
[TEE_ObjectHandle](#) key)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

Set symmetric key used in operation.

[TEE_SetOperationKey\(\)](#) - Programs the key of an operation; that is, it associates an operation with a key.

The key material is copied from the key object handle into the operation. After the key has been set, there is no longer any link between the operation and the key object. The object handle can be closed or reset and this will not affect the operation. This copied material exists until the operation is freed using TEE_FreeOperation or another key is set into the operation.

Parameters

<i>operation</i>	Operation handle.
<i>key</i>	A handle on a key object.

Returns

0 on success return

TEE_ERROR_CORRUPT_OBJECT If the object is corrupt. The object handle is closed.

TEE_ERROR_STORAGE_NOT_AVAILABLE If the persistent object is stored in a storage area which is currently inaccessible.

13.7.2.31 TEE_WriteObjectData() `TEE_Result TEE_WriteObjectData (`
`TEE_ObjectHandle object,`
`const void * buffer,`
`uint32_t size)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

Write object.

[TEE_WriteObjectData\(\)](#) - Writes the buffer data in to persistent objects.

In this function it checks if object is present or not, the encryption/ decryption buffer is taken by calling `MBEDTLS_AES_CRYPT_CBC()` then that buffer data is encrypted and mapped to object. On the base of object creation TEE_SUCCESS appears else TEE_ERROR_GENERIC appears.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

TEE_SUCCESS if success else error occurred.

[TEE_WriteObjectData\(\)](#) - writes size bytes from the buffer pointed to by buffer to the data stream associated with the open object handle object.

If the current data position points before the end-of-stream, then size bytes are written to the data stream, overwriting bytes starting at the current data position. If the current data position points beyond the stream's end, then the data stream is first extended with zero bytes until the length indicated by the data position indicator is reached, and then size bytes are written to the stream.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

TEE_SUCCESS if success else error occurred.

13.9.1 Function Documentation

13.9.1.1 TEE_AEDecryptFinal() `TEE_Result TEE_AEDecryptFinal (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen,`
`void * tag,`
`uint32_t tagLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

`TEE_AEDecryptFinal()` - Processes data that has not been processed by previous calls to `TEE_AEUpdate` as well as data supplied in `srcData`.

This function completes the AE operation and compares the computed tag with the tag supplied in the parameter `tag`. The operation handle can be reused or newly initialized. The buffers `srcData` and `destData` shall be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output

TEE_ERROR_MAC_INVALID If the computed tag does not match the supplied tag

13.9.1.2 TEE_AEEncryptFinal() `TEE_Result TEE_AEEncryptFinal (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen,`
`void * tag,`
`uint32_t * tagLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

`TEE_AEEncryptFinal()` - processes data that has not been processed by previous calls to `TEE_AEUpdate` as well as data supplied in `srcData` .

`TEE_AEEncryptFinal` completes the AE operation and computes the tag. The operation handle can be reused or newly initialized. The buffers `srcData` and `destData` SHALL be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output or tag buffer is not large enough to contain the output.

13.9.1.3 TEE_AEInit() `TEE_Result TEE_AEInit (`
`TEE_OperationHandle operation,`
`const void * nonce,`
`uint32_t nonceLen,`
`uint32_t tagLen,`
`uint32_t AADLen,`
`uint32_t payloadLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEInit\(\)](#) - Initializes an Authentication Encryption operation.

The operation must be in initial state and remains in the initial state afterwards.

Parameters

<i>operation</i>	A handle on the operation.
<i>nonce</i>	The operation nonce or IV
<i>nonceLen</i>	length of nonce
<i>tagLen</i>	Size in bits of the tag
<i>AADLen</i>	Length in bytes of the AAD
<i>payloadLen</i>	Length in bytes of the payload.

Returns

0 on success.

TEE_ERROR_NOT_SUPPORTED If the tag length is not supported by the algorithm.

13.9.1.4 TEE_AEUpdate() `TEE_Result TEE_AEUpdate (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEUpdate\(\)](#) - Accumulates data for an Authentication Encryption operation

This function describes Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. when using this routine to decrypt the returned data may be corrupt since the integrity check is not performed until all the data has been processed. If this is a concern then only use the TEE_AEDecryptFinal routine.

Parameters

<i>operation</i>	Handle of a running AE operation.
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of the input buffer.
<i>destData</i>	Output buffer
<i>destLen</i>	length of the out put buffer.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER if the output buffer is not large enough to contain the output.

13.9.1.5 TEE_AEUpdateAAD() void TEE_AEUpdateAAD (
 TEE_OperationHandle operation,
 const void * AADdata,
 uint32_t AADdataLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEUpdateAAD\(\)](#) - Feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible.

The TEE_AEUpdateAAD function feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation SHALL be in initial state and remains in initial state afterwards.

Parameters

<i>operation</i>	Handle on the AE operation
<i>AADdata</i>	Input buffer containing the chunk of AAD
<i>AADdataLen</i>	length of the chunk of AAD.

13.9.1.6 TEE_AllocateOperation() TEE_Result TEE_AllocateOperation (
 TEE_OperationHandle * operation,
 uint32_t algorithm,
 uint32_t mode,
 uint32_t maxKeySize)

Crypto, for all Crypto Functions.

[TEE_AllocateOperation\(\)](#) - Allocates a handle for a new cryptographic operation and sets the mode and algorithm type.

If this function does not return with TEE_SUCCESS then there is no valid handle value. Once a cryptographic operation has been created, the implementation shall guarantee that all resources necessary for the operation are allocated and that any operation with a key of at most maxKeySize bits can be performed. For algorithms that take multiple keys, for example the AES XTS algorithm, the maxKeySize parameter specifies the size of the largest key. It is up to the implementation to properly allocate space for multiple keys if the algorithm so requires.

Parameters

<i>operation</i>	reference to generated operation handle.
<i>algorithm</i>	One of the cipher algorithms.
<i>mode</i>	The operation mode.
<i>maxKeySize</i>	Maximum key size in bits for the operation.

Returns

0 in case of success

TEE_ERROR_OUT_OF_MEMORY If there are not enough resources to allocate the operation.

TEE_ERROR_NOT_SUPPORTED If the mode is not compatible with the algorithm or key size or if the algorithm is not one of the listed algorithms or if maxKeySize is not appropriate for the algorithm.

13.9.1.7 TEE_AllocatePersistentObjectEnumerator() *TEE_Result*

```
TEE_AllocatePersistentObjectEnumerator (
    TEE_ObjectEnumHandle * objectEnumerator )
```

13.9.1.8 TEE_AllocatePropertyEnumerator() *TEE_Result* *TEE_AllocatePropertyEnumerator* (*TEE_PropSetHandle* * *enumerator*)**13.9.1.9 TEE_AllocateTransientObject()** *TEE_Result* *TEE_AllocateTransientObject* (*TEE_ObjectType* *objectType*, *uint32_t* *maxKeySize*, *TEE_ObjectHandle* * *object*)

Crypto, Asymmetric key Verification Functions.

[TEE_AllocateTransientObject\(\)](#) - Allocates an uninitialized transient object. Transient objects are used to hold a cryptographic object (key or key-pair).

The value TEE_KEYSIZE_NO_KEY should be used for maxObjectSize for object types that do not require a key so that all the container resources can be pre-allocated. As allocated, the container is uninitialized. It can be initialized by subsequently importing the object material, generating an object, deriving an object, or loading an object from the Trusted Storage.

Parameters

<i>objectType</i>	Type of uninitialized object container to be created
<i>maxKeySize</i>	Key Size of the object.
<i>object</i>	Filled with a handle on the newly created key container.

Returns

0 on success

TEE_ERROR_OUT_OF_MEMORY If not enough resources are available to allocate the object handle.

TEE_ERROR_NOT_SUPPORTED If the key size is not supported or the object type is not supported.

13.9.1.10 TEE_AsymmetricDecrypt() `TEE_Result` TEE_AsymmetricDecrypt (

```

    TEE_OperationHandle operation,
    const TEE_Attribute * params,
    uint32_t paramCount,
    const void * srcData,
    uint32_t srcLen,
    void * destData,
    uint32_t * destLen )

```

13.9.1.11 TEE_AsymmetricEncrypt() `TEE_Result` TEE_AsymmetricEncrypt (

```

    TEE_OperationHandle operation,
    const TEE_Attribute * params,
    uint32_t paramCount,
    const void * srcData,
    uint32_t srcLen,
    void * destData,
    uint32_t * destLen )

```

13.9.1.12 TEE_AsymmetricSignDigest() `TEE_Result` TEE_AsymmetricSignDigest (

```

    TEE_OperationHandle operation,
    const TEE_Attribute * params,
    uint32_t paramCount,
    const void * digest,
    uint32_t digestLen,
    void * signature,
    uint32_t * signatureLen )

```

Crypto, Asymmetric key Verification Functions.

[TEE_AsymmetricSignDigest\(\)](#) - Signs a message digest within an asymmetric operation.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

0 on sccess

TEE_ERROR_SHORT_BUFFER If the signature buffer is not large enough to hold the result

13.9.1.13 TEE_AsymmetricVerifyDigest() `TEE_Result TEE_AsymmetricVerifyDigest (`
`TEE_OperationHandle operation,`
`const TEE_Attribute * params,`
`uint32_t paramCount,`
`const void * digest,`
`uint32_t digestLen,`
`const void * signature,`
`uint32_t signatureLen)`

Crypto, Asymmetric key Verification Functions.

[TEE_AsymmetricVerifyDigest\(\)](#) - verifies a message digest signature within an asymmetric operation.

This function describes the message digest signature verify by calling `ed25519_verify()`.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param.
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

TEE_SUCCESS on success

TEE_ERROR_SIGNATURE_INVALID if the signature is invalid.

13.9.1.14 TEE_BigIntAdd() `void TEE_BigIntAdd (`
`TEE_BigInt * dest,`
`const TEE_BigInt * op1,`

 TEE_OperationHandle operation,
 const void * srcData,
 uint32_t srcLen,
 void * destData,
 uint32_t * destLen)

[TEE_CipherDoFinal\(\)](#) - Finalizes the cipher operation, processing data that has not been processed by previous calls to TEE_CipherUpdate as well as data supplied in srcData .

This function describes The operation handle can be reused or re-initialized. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation SHALL be in active state and is set to initial state afterwards.

Parameters

<i>operation</i>	Handle of a running Cipher operation
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of input buffer
<i>destData</i>	output buffer
<i>destLen</i>	ouput buffer length.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output

13.9.1.49 TEE_CipherInit() `void` TEE_CipherInit (
 TEE_OperationHandle operation,
 const void * nonce,
 uint32_t nonceLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_CipherInit\(\)](#) - starts the symmetric cipher operation.

The operation shall have been associated with a key. If the operation is in active state, it is reset and then initialized. If the operation is in initial state, it is moved to active state.

Parameters

<i>operation</i>	A handle on an opened cipher operation setup with a key
<i>nonce</i>	Buffer containing the operation Initialization Vector as appropriate.
<i>nonceLen</i>	length of the buffer

13.9.1.50 TEE_CipherUpdate() `TEE_Result TEE_CipherUpdate (`
 `TEE_OperationHandle operation,`
 `const void * srcData,`
 `uint32_t srcLen,`
 `void * destData,`
 `uint32_t * destLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_CipherUpdate\(\)](#) - encrypts or decrypts input data.

Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. The cipher operation is finalized with a call to `TEE_CipherDoFinal`. The buffers `srcData` and `destData` SHALL be either completely disjoint or equal in their starting positions. The operation SHALL be in active state.

Parameters

<i>operation</i>	Handle of a running Cipher operation
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of input buffer
<i>destData</i>	output buffer
<i>destLen</i>	ouput buffer length.

Returns

0 on success else

`TEE_ERROR_SHORT_BUFFER` If the output buffer is not large enough to contain the output. In this case, the input is not fed into the algorithm.

13.9.1.51 TEE_CloseAndDeletePersistentObject() `void TEE_CloseAndDeletePersistentObject (`
 `TEE_ObjectHandle object)`

13.9.1.52 TEE_CloseAndDeletePersistentObject1() `TEE_Result TEE_CloseAndDeletePersistentObject1`
 `(`
 `TEE_ObjectHandle object)`

13.9.1.53 TEE_CloseObject() `void TEE_CloseObject (`
`TEE_ObjectHandle object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CloseObject\(\)](#) - Closes an opened object handle.

The object can be persistent or transient. For transient objects, TEE_CloseObject is equivalent to TEE_Free↔TransientObject.

Parameters

<i>object</i>	Handle of the object.
---------------	-----------------------

Returns

TEE_SUCCESS if success else error occurred.

[TEE_CloseObject\(\)](#) - Function closes an opened object handle.

The object can be persistent or transient. For transient objects, TEE_CloseObject is equivalent to TEE_Free↔TransientObject.

Parameters

<i>object</i>	Handle of the object
---------------	----------------------

Returns

TEE_SUCCESS if success else error occurred.

13.9.1.54 TEE_CloseTASession() `void TEE_CloseTASession (`
`TEE_TASessionHandle session)`

13.9.1.55 TEE_CopyObjectAttributes() `void TEE_CopyObjectAttributes (`
`TEE_ObjectHandle destObject,`
`TEE_ObjectHandle srcObject)`

13.9.1.56 TEE_CopyObjectAttributes1() `TEE_Result TEE_CopyObjectAttributes1 (`
`TEE_ObjectHandle destObject,`
`TEE_ObjectHandle srcObject)`

13.9.1.57 TEE_CopyOperation() void TEE_CopyOperation (
 TEE_OperationHandle dstOperation,
 TEE_OperationHandle srcOperation)

13.9.1.58 TEE_CreatePersistentObject() TEE_Result TEE_CreatePersistentObject (
 uint32_t storageID,
 const void * objectID,
 uint32_t objectIDLen,
 uint32_t flags,
 TEE_ObjectHandle attributes,
 const void * initialData,
 uint32_t initialDataLen,
 TEE_ObjectHandle * object)

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

In this function an initial data stream content returns either a handle on the created object or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

An initial data stream content, and optionally returns either a handle on the created object, or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
Paramter list continued on next page	

<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.9.1.59 TEE_DeriveKey() void TEE_DeriveKey (
 TEE_OperationHandle operation,
 const TEE_Attribute * params,
 uint32_t paramCount,
 TEE_ObjectHandle derivedKey)

13.9.1.60 TEE_DigestDoFinal() TEE_Result TEE_DigestDoFinal (
 TEE_OperationHandle operation,
 const void * chunk,
 uint32_t chunkLen,
 void * hash,
 uint32_t * hashLen)

TEE_DigestDoFinal() - Finalizes the message digest operation and produces the message hash.

This function finalizes the message digest operation and produces the message hash. Afterwards the Message Digest operation is reset to initial state and can be reused.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed.
<i>chunkLen</i>	size of the chunk.
<i>hash</i>	Output buffer filled with the message hash.
<i>hashLen</i>	length of the message hash.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the output buffer is too small. In this case, the operation is not finalized.

13.9.1.61 TEE_DigestUpdate() void TEE_DigestUpdate (
 TEE_OperationHandle operation,
 const void * chunk,
 uint32_t chunkSize)

Crypto, Message Digest Functions.

[TEE_DigestUpdate\(\)](#)- Accumulates message data for hashing.

This function describes the message does not have to be block aligned. Subsequent calls to this function are possible. The operation may be in either initial or active state and becomes active.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed
<i>chunkSize</i>	size of the chunk.

13.9.1.62 TEE_Free() void TEE_Free (
 void * buffer)

[TEE_Free\(\)](#) - causes the space pointed to by buffer to be deallocated; that is made available for further allocation.

This function describes if buffer is a NULL pointer, TEE_Free does nothing. Otherwise, it is a Programmer Error if the argument does not match a pointer previously returned by the TEE_Malloc or TEE_Realloc if the space has been deallocated by a call to TEE_Free or TEE_Realloc.

Parameters

<i>buffer</i>	The pointer to the memory block to be freed.
---------------	--

13.9.1.63 TEE_FreeOperation() void TEE_FreeOperation (
 TEE_OperationHandle operation)

Crypto, for all Crypto Functions.

[TEE_FreeOperation\(\)](#) - Deallocates all resources associated with an operation handle.

This function deallocates all resources associated with an operation handle. After this function is called, the operation handle is no longer valid. All cryptographic material in the operation is destroyed. The function does nothing if operation is TEE_HANDLE_NULL.

Parameters

<i>operation</i>	Reference to operation handle.
------------------	--------------------------------

Returns

nothing after the operation free.

13.9.1.64 TEE_FreePersistentObjectEnumerator() `void TEE_FreePersistentObjectEnumerator (
 TEE_ObjectEnumHandle objectEnumerator)`

13.9.1.65 TEE_FreePropertyEnumerator() `void TEE_FreePropertyEnumerator (
 TEE_PropSetHandle enumerator)`

13.9.1.66 TEE_FreeTransientObject() `void TEE_FreeTransientObject (
 TEE_ObjectHandle object)`

Crypto, Asymmetric key Verification Functions.

[TEE_FreeTransientObject\(\)](#) - Deallocates a transient object previously allocated with [TEE_AllocateTransientObject](#) .

this function describes the object handle is no longer valid and all resources associated with the transient object shall have been reclaimed after the [TEE_AllocateTransientObject\(\)](#) call.

Parameters

<i>object</i>	Handle on the object to free.
---------------	-------------------------------

13.9.1.67 TEE_GenerateKey() `TEE_Result TEE_GenerateKey (
 TEE_ObjectHandle object,
 uint32_t keySize,
 const TEE_Attribute * params,
 uint32_t paramCount)`

Crypto, Asymmetric key Verification Functions.

[TEE_GenerateKey \(\)](#) - Generates a random key or a key-pair and populates a transient key object with the generated key material.

The size of the desired key is passed in the keySize parameter and shall be less than or equal to the maximum key size specified when the transient object was created.

Parameters

<i>object</i>	Handle on an uninitialized transient key to populate with the generated key.
<i>keySize</i>	Requested key size shall be less than or equal to the maximum key size specified when the object container was created
<i>params</i>	Parameters for the key generation.
<i>paramCount</i>	The values of all parameters are copied into the object so that the params array and all the memory buffers it points to may be freed after this routine returns without affecting the object.

Returns

0 on success

TEE_ERROR_BAD_PARAMETERS If an incorrect or inconsistent attribute is detected. The checks that are performed depend on the implementation.

13.9.1.68 TEE_GenerateRandom() void TEE_GenerateRandom (
 void * *randomBuffer*,
 uint32_t *randomBufferLen*)

Crypto, common.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random buffer length and is stored in to random Buffer by calling wc_↵ RNG_GenerateBlock(). If ret is not equal to 0 then TEE_Panic is called.

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

Returns

random data random data will be returned.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random bufferlength and is stored in to randomBuffer by calling sgx_read_↵ _rand()).

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

13.9.1.69 TEE_GetCancellationFlag() `bool TEE_GetCancellationFlag (`
`void)`

13.9.1.70 TEE_GetInstanceData() `const void * TEE_GetInstanceData (`
`void)`

13.9.1.71 TEE_GetNextPersistentObject() `TEE_Result TEE_GetNextPersistentObject (`
`TEE_ObjectEnumHandle objectEnumerator,`
`TEE_ObjectInfo * objectInfo,`
`void * objectID,`
`uint32_t * objectIDLen)`

13.9.1.72 TEE_GetNextProperty() `TEE_Result TEE_GetNextProperty (`
`TEE_PropSetHandle enumerator)`

13.9.1.73 TEE_GetObjectBufferAttribute() `TEE_Result TEE_GetObjectBufferAttribute (`
`TEE_ObjectHandle object,`
`uint32_t attributeID,`
`void * buffer,`
`uint32_t * size)`

13.9.1.74 TEE_GetObjectInfo() `void TEE_GetObjectInfo (`
`TEE_ObjectHandle object,`
`TEE_ObjectInfo * objectInfo)`

13.9.1.75 TEE_GetObjectInfo1() `TEE_Result TEE_GetObjectInfo1 (`
`TEE_ObjectHandle object,`
`TEE_ObjectInfo * objectInfo)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_GetObjectInfo1\(\)](#) - Returns the characteristics of an object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

[TEE_GetObjectInfo1\(\)](#) - Function returns the characteristics of an object.

It returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

13.9.1.76 TEE_GetObjectValueAttribute() `TEE_Result TEE_GetObjectValueAttribute (`
 `TEE_ObjectHandle object,`
 `uint32_t attributeID,`
 `uint32_t * a,`
 `uint32_t * b)`

13.9.1.77 TEE_GetOperationInfo() `void TEE_GetOperationInfo (`
 `TEE_OperationHandle operation,`
 `TEE_OperationInfo * operationInfo)`

13.9.1.78 TEE_GetOperationInfoMultiple() `TEE_Result TEE_GetOperationInfoMultiple (`
 `TEE_OperationHandle operation,`
 `TEE_OperationInfoMultiple * operationInfoMultiple,`
 `uint32_t * operationSize)`

13.9.1.79 TEE_GetPropertyAsBinaryBlock() `TEE_Result TEE_GetPropertyAsBinaryBlock (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `void * valueBuffer,`
 `uint32_t * valueBufferLen)`

13.9.1.80 TEE_GetPropertyAsBool() `TEE_Result TEE_GetPropertyAsBool (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `bool * value)`

13.9.1.81 TEE_GetPropertyAsIdentity() `TEE_Result TEE_GetPropertyAsIdentity (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `TEE_Identity * value)`

13.9.1.82 TEE_GetPropertyAsString() `TEE_Result TEE_GetPropertyAsString (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `char * valueBuffer,`
 `uint32_t * valueBufferLen)`

13.9.1.83 TEE_GetPropertyAsU32() `TEE_Result TEE_GetPropertyAsU32 (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `uint32_t * value)`

13.9.1.84 TEE_GetPropertyAsUUID() `TEE_Result TEE_GetPropertyAsUUID (`
 `TEE_PropSetHandle propsetOrEnumerator,`
 `const char * name,`
 `TEE_UUID * value)`

13.9.1.85 TEE_GetPropertyName() `TEE_Result TEE_GetPropertyName (`
 `TEE_PropSetHandle enumerator,`
 `void * nameBuffer,`
 `uint32_t * nameBufferLen)`

13.9.1.86 TEE_GetREETime() `void TEE_GetREETime (`
 `TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetREETime\(\)](#) - Retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

[TEE_GetREETime\(\)](#) - Function retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.9.1.87 TEE_GetSystemTime() `void TEE_GetSystemTime (TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

This function describes the system time has an arbitrary implementation defined origin that can vary across TA instances. The minimum guarantee is that the system time shall be monotonic for a given TA instance.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

The system time has an arbitrary implementation-defined origin that can vary across TA instances

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.9.1.88 TEE_GetTAPersistentTime() `TEE_Result TEE_GetTAPersistentTime (TEE_Time * time)`

13.9.1.89 TEE_InitRefAttribute() `void TEE_InitRefAttribute (`
`TEE_Attribute * attr,`
`uint32_t attributeID,`
`const void * buffer,`
`uint32_t length)`

Crypto, Asymmetric key Verification Functions.

[TEE_InitRefAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

In `TEE_InitRefAttribute ()` only the buffer pointer is copied, not the content of the buffer. This means that the attribute structure maintains a pointer back to the supplied buffer. It is the responsibility of the TA author to ensure that the contents of the buffer maintain their value until the attributes array is no longer in use.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>buffer</i>	input buffer that holds the content of the attribute.
<i>length</i>	buffer length.

13.9.1.90 TEE_InitValueAttribute() `void TEE_InitValueAttribute (`
`TEE_Attribute * attr,`
`uint32_t attributeID,`
`uint32_t a,`
`uint32_t b)`

Crypto, Asymmetric key Verification Functions.

[TEE_InitValueAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>a</i>	unsigned integer value to assign to the a member of the attribute structure.
<i>b</i>	unsigned integer value to assign to the b member of the attribute structure

13.9.1.91 TEE_InvokeTACommand() `TEE_Result TEE_InvokeTACommand (`
`TEE_TASessionHandle session,`
`uint32_t cancellationRequestTimeout,`
`uint32_t commandID,`
`uint32_t paramTypes,`

```
TEE_Param params[TEE_NUM_PARAMS],  
uint32_t * returnOrigin )
```

13.9.1.92 TEE_IsAlgorithmSupported() `TEE_Result` TEE_IsAlgorithmSupported (
uint32_t algId,
uint32_t element)

13.9.1.93 TEE_MACCompareFinal() `TEE_Result` TEE_MACCompareFinal (
TEE_OperationHandle operation,
const void * message,
uint32_t messageLen,
const void * mac,
uint32_t macLen)

13.9.1.94 TEE_MACComputeFinal() `TEE_Result` TEE_MACComputeFinal (
TEE_OperationHandle operation,
const void * message,
uint32_t messageLen,
void * mac,
uint32_t * macLen)

13.9.1.95 TEE_MACInit() void TEE_MACInit (
TEE_OperationHandle operation,
const void * IV,
uint32_t IVLen)

13.9.1.96 TEE_MACUpdate() void TEE_MACUpdate (
TEE_OperationHandle operation,
const void * chunk,
uint32_t chunkSize)

13.9.1.97 TEE_Malloc() void * TEE_Malloc (
uint32_t size,
uint32_t hint)

TEE_Malloc() - Allocates space for an object whose size in bytes is specified in the parameter size.

This function describes the pointer returned is guaranteed to be aligned such that it may be assigned as a pointer to any basic C type. The valid hint values are a bitmask and can be independently set. This parameter allows Trusted Applications to refer to various pools of memory or to request special characteristics for the allocated memory by using an implementation-defined hint. Future versions of this specification may introduce additional standard hints.

Parameters

<i>size</i>	The size of the buffer to be allocated.
<i>hint</i>	A hint to the allocator.

Returns

Upon successful completion, with size not equal to zero, the function returns a pointer to the allocated space.

13.9.1.98 TEE_MaskCancellation() `bool TEE_MaskCancellation (`
 `void)`

13.9.1.99 TEE_MemCompare() `int32_t TEE_MemCompare (`
 `const void * buffer1,`
 `const void * buffer2,`
 `uint32_t size)`

13.9.1.100 TEE_MemFill() `void * TEE_MemFill (`
 `void * buff,`
 `uint32_t x,`
 `uint32_t size)`

13.9.1.101 TEE_MemMove() `void * TEE_MemMove (`
 `void * dest,`
 `const void * src,`
 `uint32_t size)`

13.9.1.102 TEE_OpenPersistentObject() `TEE_Result TEE_OpenPersistentObject (`
 `uint32_t storageID,`
 `const void * objectID,`
 `uint32_t objectIDLen,`
 `uint32_t flags,`
 `TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.9.1.103 TEE_OpenTASession() `TEE_Result TEE_OpenTASession (`
 const `TEE_UUID` * *destination*,
 uint32_t *cancellationRequestTimeout*,
 uint32_t *paramTypes*,
 `TEE_Param` *params*[`TEE_NUM_PARAMS`],
 `TEE_TASessionHandle` * *session*,
 uint32_t * *returnOrigin*)

13.9.1.104 TEE_Panic() `void TEE_Panic (`
 `TEE_Result` *panicCode*)

13.9.1.105 TEE_PopulateTransientObject() `TEE_Result` TEE_PopulateTransientObject (
 `TEE_ObjectHandle` *object*,
 const `TEE_Attribute` * *attrs*,
 uint32_t *attrCount*)

13.9.1.106 TEE_ReadObjectData() `TEE_Result` TEE_ReadObjectData (
 `TEE_ObjectHandle` *object*,
 void * *buffer*,
 uint32_t *size*,
 uint32_t * *count*)

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion of TEE_ReadObjectData sets the number of bytes actually read in the "uint32_t" pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success else error occurred.

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion TEE_ReadObjectData sets the number of bytes actually read in the uint32_t pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success, else error occurred.

13.9.1.107 TEE_Realloc() `void * TEE_Realloc (`
`void * buffer,`
`uint32_t newSize)`

[TEE_Realloc\(\)](#) - Changes the size of the memory object pointed to by *buffer* to the size specified by *new size*.

This function describes the content of the object remains unchanged up to the lesser of the new and old sizes. Space in excess of the old size contains unspecified content. If the new size of the memory object requires movement of the object, the space for the previous instantiation of the object is deallocated. If the space cannot be allocated, the original object remains allocated, and this function returns a NULL pointer.

Parameters

<i>buffer</i>	The pointer to the object to be reallocated.
<i>newSize</i>	The new size required for the object

Returns

Upon successful completion, TEE_Realloc returns a pointer to the (possibly moved) allocated space. If there is not enough available memory, TEE_Realloc returns a NULL pointer and the original buffer is still allocated and unchanged.

13.9.1.108 TEE_RenamePersistentObject() `TEE_Result TEE_RenamePersistentObject (`
`TEE_ObjectHandle object,`
`const void * newObjectID,`
`uint32_t newObjectIDLen)`

13.9.1.109 TEE_ResetOperation() `void TEE_ResetOperation (`
`TEE_OperationHandle operation)`

13.9.1.110 TEE_ResetPersistentObjectEnumerator() `void TEE_ResetPersistentObjectEnumerator (`
`TEE_ObjectEnumHandle objectEnumerator)`

13.9.1.111 TEE_ResetPropertyEnumerator() void TEE_ResetPropertyEnumerator (
 TEE_PropSetHandle enumerator)

13.9.1.112 TEE_ResetTransientObject() void TEE_ResetTransientObject (
 TEE_ObjectHandle object)

13.9.1.113 TEE_RestrictObjectUsage() void TEE_RestrictObjectUsage (
 TEE_ObjectHandle object,
 uint32_t objectUsage)

13.9.1.114 TEE_RestrictObjectUsage1() TEE_Result TEE_RestrictObjectUsage1 (
 TEE_ObjectHandle object,
 uint32_t objectUsage)

13.9.1.115 TEE_SeekObjectData() TEE_Result TEE_SeekObjectData (
 TEE_ObjectHandle object,
 int32_t offset,
 TEE_Whence whence)

13.9.1.116 TEE_SetInstanceData() void TEE_SetInstanceData (
 const void * instanceData)

13.9.1.117 TEE_SetOperationKey() TEE_Result TEE_SetOperationKey (
 TEE_OperationHandle operation,
 TEE_ObjectHandle key)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_SetOperationKey\(\)](#) - Programs the key of an operation; that is, it associates an operation with a key.

The key material is copied from the key object handle into the operation. After the key has been set, there is no longer any link between the operation and the key object. The object handle can be closed or reset and this will not affect the operation. This copied material exists until the operation is freed using [TEE_FreeOperation](#) or another key is set into the operation.

Parameters

<i>operation</i>	Operation handle.
<i>key</i>	A handle on a key object.

Returns

0 on success return

TEE_ERROR_CORRUPT_OBJECT If the object is corrupt. The object handle is closed.

TEE_ERROR_STORAGE_NOT_AVAILABLE If the persistent object is stored in a storage area which is currently inaccessible.

13.9.1.118 TEE_SetOperationKey2() `TEE_Result TEE_SetOperationKey2 (`
 `TEE_OperationHandle operation,`
 `TEE_ObjectHandle key1,`
 `TEE_ObjectHandle key2)`

13.9.1.119 TEE_SetTAPersistentTime() `TEE_Result TEE_SetTAPersistentTime (`
 `const TEE_Time * time)`

13.9.1.120 TEE_StartPersistentObjectEnumerator() `TEE_Result TEE_StartPersistentObjectEnumerator`
 `(`
 `TEE_ObjectEnumHandle objectEnumerator,`
 `uint32_t storageID)`

13.9.1.121 TEE_StartPropertyEnumerator() `void TEE_StartPropertyEnumerator (`
 `TEE_PropSetHandle enumerator,`
 `TEE_PropSetHandle propSet)`

13.9.1.122 TEE_TruncateObjectData() `TEE_Result TEE_TruncateObjectData (`
 `TEE_ObjectHandle object,`
 `uint32_t size)`

13.9.1.123 TEE_UnmaskCancellation() `bool TEE_UnmaskCancellation (`
 `void)`

13.9.1.124 TEE_Wait() `TEE_Result TEE_Wait (`
`uint32_t timeout)`

13.9.1.125 TEE_WriteObjectData() `TEE_Result TEE_WriteObjectData (`
`TEE_ObjectHandle object,`
`const void * buffer,`
`uint32_t size)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_WriteObjectData\(\)](#) - Writes the buffer data in to persistent objects.

In this function it checks if object is present or not, the encryption/ decryption buffer is taken by calling `mbedtls_aes_crypt_cbc()` then that buffer data is encrypted and mapped to object. On the base of object creation `TEE_SUCCESS` appears else `TEE_ERROR_GENERIC` appears.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

`TEE_SUCCESS` if success else error occurred.

[TEE_WriteObjectData\(\)](#) - writes size bytes from the buffer pointed to by buffer to the data stream associated with the open object handle object.

If the current data position points before the end-of-stream, then size bytes are written to the data stream, overwriting bytes starting at the current data position. If the current data position points beyond the stream's end, then the data stream is first extended with zero bytes until the length indicated by the data position indicator is reached, and then size bytes are written to the stream.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

`TEE_SUCCESS` if success else error occurred.

13.17.1.1 [TEEC_Result](#) typedef uint32_t [TEEC_Result](#)

13.17.2 Function Documentation

13.17.2.1 [TEEC_AllocateSharedMemory\(\)](#) [TEEC_Result](#) [TEEC_AllocateSharedMemory](#) ([TEEC_Context](#) * context, [TEEC_SharedMemory](#) * sharedMem)

[TEEC_AllocateSharedMemory\(\)](#) - Allocate shared memory for TEE.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>sharedMem</i>	Pointer to the allocated shared memory.

Returns

TEEC_SUCCESS The registration was successful.
TEEC_ERROR_OUT_OF_MEMORY Memory exhaustion.
TEEC_Result Something failed.

13.17.2.2 TEEC_CloseSession() `void TEEC_CloseSession (`
`TEEC_Session * session)`

[TEEC_CloseSession\(\)](#) - Closes the session which has been opened with the specific trusted application.

Parameters

<i>session</i>	The opened session to close.
----------------	------------------------------

13.17.2.3 TEEC_FinalizeContext() `void TEEC_FinalizeContext (`
`TEEC_Context * context)`

[TEEC_FinalizeContext\(\)](#) - Destroys a context holding connection information on the specific TEE.

This function destroys an initialized TEE context, closing the connection between the client application and the TEE. This function must only be called when all sessions related to this TEE context have been closed and all shared memory blocks have been released.

Parameters

<i>context</i>	The context to be destroyed.
----------------	------------------------------

[TEEC_FinalizeContext\(\)](#) - Destroys a context holding connection information on the specific TEE.

This function finalizes an initialized TEE context, closing the connection between the client application and the TEE. This function must only be called when all sessions related to this TEE context have been closed and all shared memory blocks have been released.

Parameters

<i>context</i>	The context to be finalized.
----------------	------------------------------

13.17.2.4 TEEC_InitializeContext() `TEEC_Result TEEC_InitializeContext (`
 `const char * name,`
 `TEEC_Context * context)`

[TEEC_InitializeContext\(\)](#) - Initializes a context holding connection information on the specific TEE, designated by the name string.

Parameters

<i>name</i>	A zero-terminated string identifying the TEE to connect to. If name is set to NULL, the default TEE is connected to. NULL is the only supported value in this version of the API implementation.
<i>context</i>	The context structure which is to be initialized.

Returns

TEEC_SUCCESS The initialization was successful.

TEEC_Result Something failed.

13.17.2.5 TEEC_InvokeCommand() `TEEC_Result TEEC_InvokeCommand (`
 `TEEC_Session * session,`
 `uint32_t commandID,`
 `TEEC_Operation * operation,`
 `uint32_t * returnOrigin)`

[TEEC_InvokeCommand\(\)](#) - Executes a command in the specified trusted application.

Parameters

<i>session</i>	A handle to an open connection to the trusted application.
<i>commandID</i>	Identifier of the command in the trusted application to invoke.
<i>operation</i>	An operation structure to use in the invoke command. May be set to NULL to signify no operation structure needed.
<i>returnOrigin</i>	A parameter which will hold the error origin if this function returns any value other than TEEC_SUCCESS.

Returns

TEEC_SUCCESS OpenSession successfully opened a new session.

TEEC_Result Something failed.

13.17.2.6 TEEC_OpenSession() `TEEC_Result TEEC_OpenSession (`
`TEEC_Context * context,`
`TEEC_Session * session,`
`const TEEC_UUID * destination,`
`uint32_t connectionMethod,`
`const void * connectionData,`
`TEEC_Operation * operation,`
`uint32_t * returnOrigin)`

[TEEC_OpenSession\(\)](#) - Opens a new session with the specified trusted application.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>session</i>	The session to initialize.
<i>destination</i>	A structure identifying the trusted application with which to open a session.
<i>connectionMethod</i>	The connection method to use.
<i>connectionData</i>	Any data necessary to connect with the chosen connection method. Not supported, should be set to NULL.
<i>operation</i>	An operation structure to use in the session. May be set to NULL to signify no operation structure needed.
<i>returnOrigin</i>	A parameter which will hold the error origin if this function returns any value other than TEEC_SUCCESS.

Returns

TEEC_SUCCESS OpenSession successfully opened a new session.

TEEC_Result Something failed.

13.17.2.7 TEEC_RegisterSharedMemory() `TEEC_Result TEEC_RegisterSharedMemory (`
`TEEC_Context * context,`
`TEEC_SharedMemory * sharedMem)`

[TEEC_RegisterSharedMemory\(\)](#) - Register a block of existing memory as a shared block within the scope of the specified context.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>sharedMem</i>	pointer to the shared memory structure to register.

Returns

TEEC_SUCCESS The registration was successful.

TEEC_ERROR_OUT_OF_MEMORY Memory exhaustion.

TEEC_Result Something failed.

13.17.2.8 TEEC_ReleaseSharedMemory() `void TEEC_ReleaseSharedMemory (`
`TEEC_SharedMemory * sharedMemory)`

[TEEC_ReleaseSharedMemory\(\)](#) - Free or deregister the shared memory.

Parameters

<i>sharedMem</i>	Pointer to the shared memory to be freed.
------------------	---

13.17.2.9 TEEC_RequestCancellation() `void TEEC_RequestCancellation (`
`TEEC_Operation * operation)`

[TEEC_RequestCancellation\(\)](#) - Request the cancellation of a pending open session or command invocation.

Parameters

<i>operation</i>	Pointer to an operation previously passed to open session or invoke.
------------------	--

41  * TA Interface
42  *
43  * Each Trusted Application must provide the Implementation with a number
44  * of functions, collectively called the "TA interface". These functions
45  * are the entry points called by the Trusted Core Framework to create the
46  * instance, notify the instance that a new client is connecting, notify
47  * the instance when the client invokes a command, etc.
48  *
49  * Trusted Application Entry Points:
50  */
51
52 /*
53  * The function TA_CreateEntryPoint is the Trusted Application's
54  * constructor, which the Framework calls when it creates a new instance of
55  * the Trusted Application. To register instance data, the implementation
56  * of this constructor can use either global variables or the function
57  * TEE_InstanceSetData.
58  *
59  * Return Value:
60  * - TEE_SUCCESS: if the instance is successfully created, the function
61  *   must return TEE_SUCCESS.
62  * - Any other value: if any other code is returned the instance is not
63  *   created, and no other entry points of this instance will be called.
64  * The Framework MUST reclaim all resources and dereference all objects
65  * related to the creation of the instance.
66  *
67  * If this entry point was called as a result of a client opening a
68  * session, the error code is returned to the client and the session is
69  * not opened.
70  */
71 TEE_Result TA_EXPORT TA_CreateEntryPoint(void);
72
73 /*
74  * The function TA_DestroyEntryPoint is the Trusted Applications
75  * destructor, which the Framework calls when the instance is being
76  * destroyed.
77  *
78  * When the function TA_DestroyEntryPoint is called, the Framework
79  * guarantees that no client session is currently open. Once the call to
80  * TA_DestroyEntryPoint has been completed, no other entry point of this
81  * instance will ever be called.
82  *
83  * Note that when this function is called, all resources opened by the
84  * instance are still available. It is only after the function returns that
85  * the Implementation MUST start automatically reclaiming resources left

```

```

86  * opened.
87  *
88  * Return Value:
89  * This function can return no success or error code. After this function
90  * returns the Implementation MUST consider the instance destroyed and
91  * reclaims all resources left open by the instance.
92  */
93 void TA_EXPORT TA_DestroyEntryPoint(void);
94
95 /*
96  * The Framework calls the function TA_OpenSessionEntryPoint when a client
97  * requests to open a session with the Trusted Application. The open
98  * session request may result in a new Trusted Application instance being
99  * created as defined in section 4.5.
100  *
101  * The client can specify parameters in an open operation which are passed
102  * to the Trusted Application instance in the arguments paramTypes and
103  * params. These arguments can also be used by the Trusted Application
104  * instance to transfer response data back to the client. See section 4.3.6
105  * for a specification of how to handle the operation parameters.
106  *
107  * If this function returns TEE_SUCCESS, the client is connected to a
108  * Trusted Application instance and can invoke Trusted Application
109  * commands. When the client disconnects, the Framework will eventually
110  * call the TA_CloseSessionEntryPoint entry point.
111  *
112  * If the function returns any error, the Framework rejects the connection
113  * and returns the error code and the current content of the parameters the
114  * client. The return origin is then set to TEE_ORIGIN_TRUSTED_APP.
115  *
116  * The Trusted Application instance can register a session data pointer by
117  * setting *psessionContext. The value of this pointer is not interpreted
118  * by the Framework, and is simply passed back to other TA_ functions
119  * within this session. Note that *sessionContext may be set with a pointer
120  * to a memory allocated by the Trusted Application instance or with
121  * anything else, like an integer, a handle etc. The Framework will not
122  * automatically free *sessionContext when the session is closed; the
123  * Trusted Application instance is responsible for freeing memory if
124  * required.
125  *
126  * During the call to TA_OpenSessionEntryPoint the client may request to
127  * cancel the operation. See section 4.10 for more details on
128  * cancellations. If the call to TA_OpenSessionEntryPoint returns
129  * TEE_SUCCESS, the client must consider the session as successfully opened
130  * and explicitly close it if necessary.
131  *
132  * Parameters:
133  * - paramTypes: the types of the four parameters.
134  * - params: a pointer to an array of four parameters.
135  * - sessionContext: A pointer to a variable that can be filled by the
136  *   Trusted Application instance with an opaque void* data pointer
137  *
138  * Return Value:
139  * - TEE_SUCCESS if the session is successfully opened.
140  * - Any other value if the session could not be open.
141  *   o The error code may be one of the pre-defined codes, or may be a new
142  *     error code defined by the Trusted Application implementation itself.
143  */
144 TEE_Result TA_EXPORT TA_OpenSessionEntryPoint(uint32_t paramTypes,
145        TEE_Param params[TEE_NUM_PARAMS],
146        void **sessionContext);
147
148 /*
149  * The Framework calls this function to close a client session. During the
150  * call to this function the implementation can use any session functions.
151  *
152  * The Trusted Application implementation is responsible for freeing any
153  * resources consumed by the session being closed. Note that the Trusted
154  * Application cannot refuse to close a session, but can hold the closing
155  * until it returns from TA_CloseSessionEntryPoint. This is why this
156  * function cannot return an error code.
157  *
158  * Parameters:
159  * - sessionContext: The value of the void* opaque data pointer set by the
160  *   Trusted Application in the function TA_OpenSessionEntryPoint for this
161  *   session.
162  */
163 void TA_EXPORT TA_CloseSessionEntryPoint(void *sessionContext);
164
165 /*
166  * The Framework calls this function when the client invokes a command
167  * within the given session.
168  *
169  * The Trusted Application can access the parameters sent by the client
170  * through the paramTypes and params arguments. It can also use these

```

```

171 * arguments to transfer response data back to the client.
172 *
173 * During the call to TA_InvokeCommandEntryPoint the client may request to
174 * cancel the operation.
175 *
176 * A command is always invoked within the context of a client session.
177 * Thus, any session function can be called by the command implementation.
178 *
179 * Parameter:
180 * - sessionContext: The value of the void* opaque data pointer set by the
181 *   Trusted Application in the function TA_OpenSessionEntryPoint.
182 * - commandID: A Trusted Application-specific code that identifies the
183 *   command to be invoked.
184 * - paramTypes: the types of the four parameters.
185 * - params: a pointer to an array of four parameters.
186 *
187 * Return Value:
188 * - TEE_SUCCESS: if the command is successfully executed, the function
189 *   must return this value.
190 * - Any other value: if the invocation of the command fails for any
191 *   reason.
192 *   o The error code may be one of the pre-defined codes, or may be a new
193 *   error code defined by the Trusted Application implementation itself.
194 */
195
196 TEE_Result TA_EXPORT TA_InvokeCommandEntryPoint(void *sessionContext,
197         uint32_t commandID,
198         uint32_t paramTypes,
199         TEE_Param params[TEE_NUM_PARAMS]);
200
201 /*
202 * Correspondance Client Functions <--> TA Functions
203 *
204 * TEE_OpenSession or TEE_OpenTASession:
205 * If a new Trusted Application instance is needed to handle the session,
206 * TA_CreateEntryPoint is called.
207 * Then, TA_OpenSessionEntryPoint is called.
208 *
209 *
210 * TEE_InvokeCommand or TEE_InvokeTACommand:
211 * TA_InvokeCommandEntryPoint is called.
212 *
213 *
214 * TEE_CloseSession or TEE_CloseTASession:
215 * TA_CloseSessionEntryPoint is called.
216 * For a multi-instance TA or for a single-instance, non keep-alive TA, if
217 * the session closed was the last session on the instance, then
218 * TA_DestroyEntryPoint is called. Otherwise, the instance is kept until
219 * the TEE shuts down.
220 *
221 */

13.33 ta-ref/api/keystone/crt.c File Reference

```

#include "crt.h"
#include "edger/Enclave_t.h"

```

Include dependency graph for crt.c:

Functions

- void `crt_end` (void)

Variables

- static void(*const `init_array` [])() `__attribute__((section(".init_array")))`
- static void(*const `aligned` []) (sizeof(void *))
- static void(*const `fini_array` [])() `__attribute__((section(".fini_array")))`
- void(* `__init_array_start` []) (void)

13.33.1 Function Documentation

13.33.1.1 crt_end() void crt_end (void)

`crt_end()` - Ends the certification.

It compares `__fini_array_start` and `__fini_array_end`; and then it the loops through the file pointer.

13.33.2 Variable Documentation

13.33.2.1 `__init_array_start` `void(* __init_array_start[]) (void) (void) [extern]`

`crt_begin()` - Commences the certification.

It compares `__init_array_start` and `__init_array_end`; and then it the loops through the file pointer.

13.33.2.2 `aligned` `void(*const aligned[])(sizeof(void *)) (sizeof(void *))`

Initial value:

```
= {
}
```

13.33.2.3 `fini_array` `void(*const fini_array[]) () __attribute__((section(".fini_array"))) [static]`

Termination array for the executable.

This section holds an array of function pointers that contributes to a single termination array for the executable or shared object containing the section and if defined is `PERF_ENABLE` then unmapping the profiler information.

Parameters

<code>fini_array[]</code>	constant array.
---------------------------	-----------------

13.33.2.4 `init_array` `void(*const init_array[]) () __attribute__((section(".init_array"))) [static]`

Initialization array for the executable.

This section holds an array of function pointers that contributes to a single initialization array for the executable or shared object containing the section if defined is `PERF_ENABLE` then mapping the profiler information.

Parameters

<code>init_array[]</code>	constant array.
---------------------------	-----------------

13.34 ta-ref/api/sgx/crt.c File Reference

Functions

- [TEE_Result TA_InvokeCommandEntryPoint](#) (void *sess_ctx, uint32_t cmd_id, uint32_t param_types, TEE_Param params[4])
- void EAPP_ENTRY [eapp_entry](#) ()

13.47.1 Function Documentation

13.47.1.1 eapp_entry() `void EAPP_ENTRY eapp_entry ()`

The `eapp_entry()` - It contains enclave verbose and invokes main function.

This function invokes `crt_begin()` if defined macro is `ENCLAVE_VERBOSE` then prints the main start and invokes `main()`. Once `main()` is completed prints the main end and invokes the `crt_end()`.

Returns

It will return `EAPP_RETURN(0)`.

13.47.1.2 TA_InvokeCommandEntryPoint() `TEE_Result TA_InvokeCommandEntryPoint (void * sess_ctx, uint32_t cmd_id, uint32_t param_types, TEE_Param params[4])`

Include dependency graph for `tee-internal-api-machine.c`:

Functions

- void `__attribute__((noreturn))`

13.49.1 Function Documentation

13.49.1.1 `__attribute__((noretun)) void __attribute__((noretun))`

TEE_Panic() - Raises a panic in the Trusted Application instance.

When a Trusted Application calls the TEE_Panic function, the current instance shall be destroyed and all the resources opened by the instance shall be reclaimed. All sessions opened from the panicking instance on another TA shall be gracefully closed and all cryptographic objects and operations shall be closed properly.

Parameters

<i>code</i>	An informative panic code defined by the TA.
-------------	--

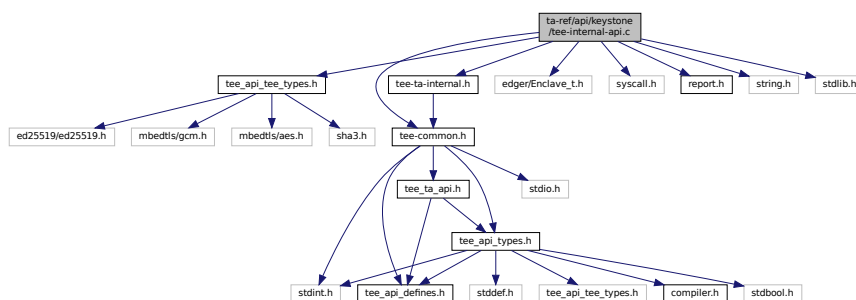

Returns

panic code will be returned.

13.50 ta-ref/api/keystone/tee-internal-api.c File Reference

Crypto, common.

Variables

- static int [wc_rng_init](#) = 0
- static WC_RNG [rngstr](#)

13.50.1 Function Documentation

13.50.1.1 flags2flags() static int flags2flags (
int flags) [inline], [static]

[flags2flags\(\)](#) - Checks the status for reading or writing of the file operational.

This function is used to check the status for reading or writing of the file operational.

Parameters

<i>flags</i>	Flags of the referencing node.
--------------	--------------------------------

Returns

ret if success.

13.50.1.2 get_wc_rng() WC_RNG * get_wc_rng (
 void)

[get_wc_rng\(\)](#) - Gets the seed (from OS) and key cipher for rng (random number genertor).

This function returns the random number or unique number of "rngstr".

Returns

random number if success else error occured.

13.50.1.3 GetRelTimeEnd() TEE_Result GetRelTimeEnd (
 uint64_t end)

Core Functions, Time Functions.

[GetRelTimeEnd\(\)](#) - finds the real time of the end timing.

This function prints the ending time.

Parameters

<i>end</i>	End timing
------------	------------

Returns

0 If success

13.50.1.4 GetRelTimeStart() TEE_Result GetRelTimeStart (
 uint64_t start)

Core Functions, Time Functions.

[GetRelTimeStart\(\)](#) - Gets the real time of the start timing.

This function prints the starting time.

Parameters

<i>start</i>	Start timing
--------------	--------------

Returns

0 on success

13.50.1.5 OpenPersistentObject() static `TEE_Result` OpenPersistentObject (
 uint32_t *storageID*,
 const void * *objectID*,
 uint32_t *objectIDLen*,
 uint32_t *flags*,
 TEE_ObjectHandle * *object*,
 int *ocreat*) [static]

[OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

The flags parameter is a set of flags that controls the access rights and sharing permissions with which the object handle is opened. The value of the flags parameter is constructed by a bitwise-inclusive OR of flags TEE_DATA_FLAG_ACCESS_READ, the object is opened with the read access right. This allows the Trusted Application to call the function TEE_ReadObjectData. TEE_DATA_FLAG_ACCESS_WRITE, the object is opened with the write access right. TEE_DATA_FLAG_ACCESS_WRITE_META, the object is opened with the write-meta access right.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	length of the identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion.

Returns

0 if success else error occurred.

13.50.1.6 set_object_key() static int set_object_key (
 void * *id*,
 unsigned int *idlen*,
 TEE_ObjectHandle *object*) [static]

[set_object_key\(\)](#) - Initialize report and then attest enclave with file.

This function describes the initialization of report, attest the enclave with file id and its length then assigned to ret. Based on "mbedtls" key encryption and decryption position of the object will be copied. Finally ret value returns on success else signature too short error will appear on failure.

Parameters

<i>id</i>	id of the object.
<i>idlen</i>	length of the id.
<i>object</i>	TEE_ObjectHandle type handle.

Returns

ret if success.

13.50.1.7 TEE_CloseObject() `void TEE_CloseObject (`
`TEE_ObjectHandle object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CloseObject\(\)](#) - Closes an opened object handle.

The object can be persistent or transient. For transient objects, TEE_CloseObject is equivalent to TEE_Free↵ TransientObject.

Parameters

<i>object</i>	Handle of the object.
---------------	-----------------------

Returns

TEE_SUCCESS if success else error occurred.

13.50.1.8 TEE_CreatePersistentObject() `TEE_Result TEE_CreatePersistentObject (`
`uint32_t storageID,`
`const void * objectID,`
`uint32_t objectIDLen,`
`uint32_t flags,`
`TEE_ObjectHandle attributes,`
`const void * initialData,`
`uint32_t initialDataLen,`
`TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

In this function an initial data stream content returns either a handle on the created object or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

13.50.1.9 TEE_Free() `void TEE_Free (`
`void * buffer)`

[TEE_Free\(\)](#) - causes the space pointed to by *buffer* to be deallocated; that is made available for further allocation.

This function describes if *buffer* is a NULL pointer, TEE_Free does nothing. Otherwise, it is a Programmer Error if the argument does not match a pointer previously returned by the TEE_Malloc or TEE_Realloc if the space has been deallocated by a call to TEE_Free or TEE_Realloc.

Parameters

<i>buffer</i>	The pointer to the memory block to be freed.
---------------	--

13.50.1.10 TEE_GenerateRandom() `void TEE_GenerateRandom (`
`void * randomBuffer,`
`uint32_t randomBufferLen)`

Crypto, common.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random buffer length and is stored in to random Buffer by calling `wc_↵ RNG_GenerateBlock()`. If *ret* is not equal to 0 then TEE_Panic is called.

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

Returns

random data random data will be returned.

13.50.1.11 TEE_GetObjectInfo1() `TEE_Result TEE_GetObjectInfo1 (`
 `TEE_ObjectHandle object,`
 `TEE_ObjectInfo * objectInfo)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_GetObjectInfo1\(\)](#) - Returns the characteristics of an object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

13.50.1.12 TEE_GetREETime() `void TEE_GetREETime (`
 `TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetREETime\(\)](#) - Retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

13.50.1.13 TEE_GetSystemTime() `void TEE_GetSystemTime (`
`TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

This function describes the system time has an arbitrary implementation defined origin that can vary across TA instances. The minimum guarantee is that the system time shall be monotonic for a given TA instance.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds
-------------	--

13.50.1.14 TEE_Malloc() `void * TEE_Malloc (`
`uint32_t size,`
`uint32_t hint)`

[TEE_Malloc\(\)](#) - Allocates space for an object whose size in bytes is specified in the parameter size.

This function describes the pointer returned is guaranteed to be aligned such that it may be assigned as a pointer to any basic C type. The valid hint values are a bitmask and can be independently set. This parameter allows Trusted Applications to refer to various pools of memory or to request special characteristics for the allocated memory by using an implementation-defined hint. Future versions of this specification may introduce additional standard hints.

Parameters

<i>size</i>	The size of the buffer to be allocated.
<i>hint</i>	A hint to the allocator.

Returns

Upon successful completion, with size not equal to zero, the function returns a pointer to the allocated space.

13.50.1.15 TEE_OpenPersistentObject() `TEE_Result TEE_OpenPersistentObject (`
`uint32_t storageID,`
`const void * objectID,`
`uint32_t objectIDLen,`
`uint32_t flags,`
`TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle which can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success else error occurred.

13.50.1.16 TEE_ReadObjectData() `TEE_Result TEE_ReadObjectData (`
`TEE_ObjectHandle object,`
`void * buffer,`
`uint32_t size,`
`uint32_t * count)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion of TEE_ReadObjectData sets the number of bytes actually read in the "uint32_t" pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success else error occurred.

13.50.1.17 TEE_Realloc() `void * TEE_Realloc (`
`void * buffer,`
`uint32_t newSize)`

[TEE_Realloc\(\)](#) - Changes the size of the memory object pointed to by *buffer* to the size specified by *new size*.

This function describes the content of the object remains unchanged up to the lesser of the new and old sizes. Space in excess of the old size contains unspecified content. If the new size of the memory object requires movement of the object, the space for the previous instantiation of the object is deallocated. If the space cannot be allocated, the original object remains allocated, and this function returns a NULL pointer.

Parameters

<i>buffer</i>	The pointer to the object to be reallocated.
<i>newSize</i>	The new size required for the object

Returns

Upon successful completion, TEE_Realloc returns a pointer to the (possibly moved) allocated space. If there is not enough available memory, TEE_Realloc returns a NULL pointer and the original buffer is still allocated and unchanged.

13.50.1.18 TEE_WriteObjectData() `TEE_Result TEE_WriteObjectData (`
`TEE_ObjectHandle object,`
`const void * buffer,`
`uint32_t size)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_WriteObjectData\(\)](#) - Writes the buffer data in to persistent objects.

In this function it checks if object is present or not, the encryption/ decryption buffer is taken by calling `mbedtls_aes_crypt_cbc()` then that buffer data is encrypted and mapped to object. On the base of object creation TEE_SUCCESS appears else TEE_ERROR_GENERIC appears.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

TEE_SUCCESS if success else error occurred.

13.50.1.19 wc_ocall_genseed() `int wc_ocall_genseed (`
 `void * nonce,`
 `uint32_t len)`

[wc_ocall_genseed\(\)](#) To generate random data.

This function describes the return value of random generated data. if generated random value is not equal to length of buffer then panic reason occurs.

Parameters

<i>nonce</i>	pointer of buffer
<i>len</i>	length of the buffer.

Returns

0 on success else error will occur based on panic raised inside trusted application.

13.50.2 Variable Documentation

13.50.2.1 rngstr `WC_RNG rngstr [static]`

13.50.2.2 wc_rng_init `int wc_rng_init = 0 [static]`

`ocall_getrandom()` - For getting random data.

This function describes that the retval is returned based on the size of buffer by calling the functions `ocall_getrandom196` and `ocall_getrandom16`

Parameters

<i>buf</i>	character type buffer
<i>len</i>	size of the buffer
<i>flags</i>	unassigned integer flag

Returns

retval value will be returned based on length of buffer.

13.51.1 Function Documentation

13.51.1.1 `__attribute__()` `void __attribute__ (`
`(noreturn))`

`TEE_Panic()` - Raises a Panic in the Trusted Application instance

When a Trusted Application calls the `TEE_Panic` function, the current instance shall be destroyed and all the resources opened by the instance shall be reclaimed.

Parameters

<code>ec</code>	An informative panic code defined by the TA. May be displayed in traces if traces are available.
-----------------	--

13.51.1.2 `flags2flags()` `static int flags2flags (`
`int flags) [inline], [static]`

`flags2flags()` - Checks the status for reading or writing of the file operational.

This function is to check the status for reading or writing of the file operational.

Parameters

<code>flags</code>	Flags of the referencing node.
--------------------	--------------------------------

Returns

0 if success else error occurred.

13.51.1.3 `get_wc_rng()` `static WC_RNG * get_wc_rng (`
`void) [static]`

`get_wc_rng()` - Gets the seed (from OS) and key cipher for rng(random number genertor).

This function returns the random number or unique number of "rngstr".

Returns

random number if success else error occurred.

13.51.1.4 GetRelTimeEnd() `TEE_Result GetRelTimeEnd (`
`uint64_t end)`

Core Functions, Time Functions.

[GetRelTimeStart\(\)](#) - find the real time of the end timing.

This function prints the End timing.

Parameters

<i>end</i>	End timing
------------	------------

Returns

0 if success else error occurred

13.51.1.5 GetRelTimeStart() `TEE_Result GetRelTimeStart (`
`uint64_t start)`

Core Functions, Time Functions.

[GetRelTimeStart\(\)](#) - Gets the real time of the start timing.

This function prints the start timing.

Parameters

<i>start</i>	start timing
--------------	--------------

Returns

0 if success else error occurred.

13.51.1.6 OpenPersistentObject() `static TEE_Result OpenPersistentObject (`
`uint32_t storageID,`
`const void * objectID,`

```

uint32_t objectIDLen,
uint32_t flags,
TEE_ObjectHandle * object,
int ocreat ) [static]

```

OpenPersistentObject() - Opens a handle on an existing persistent object.

The flags parameter is a set of flags that controls the access rights and sharing permissions with which the object handle is opened. The value of the flags parameter is constructed by a bitwise-inclusive OR of flags TEE_DATA_FLAG_ACCESS_READ, the object is opened with the read access right. This allows the Trusted Application to call the function TEE_ReadObjectData. TEE_DATA_FLAG_ACCESS_WRITE, the object is opened with the write access right. TEE_DATA_FLAG_ACCESS_WRITE_META, the object is opened with the write-meta access right.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	length of the identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion.

Returns

0 if success else error occurred.

13.51.1.7 set_object_key() static int set_object_key (
const void * id,
unsigned int idlen,
TEE_ObjectHandle object) [static]

set_object_key - To initialize report and then attest enclave with file.

This function describes objectID as key_id to make the key dependent on it. sgx report key is 128-bit. Fill another 128-bit with seal key. seal key doesn't change with enclave. Better than nothing, though. random nonce can not use for AES here because of persistency. the digest of attestation report and objectID as the last resort has been used.

Parameters

<i>id</i>	id of the object.
<i>idlen</i>	length of the id.
<i>object</i>	TEE_ObjectHandle type handle.

Returns

0 if success else error occurred.

13.51.1.8 TEE_CloseObject() `void TEE_CloseObject (`
`TEE_ObjectHandle object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CloseObject\(\)](#) - Function closes an opened object handle.

The object can be persistent or transient. For transient objects, TEE_CloseObject is equivalent to TEE_Free↔TransientObject.

Parameters

<i>object</i>	Handle of the object
---------------	----------------------

Returns

TEE_SUCCESS if success else error occurred.

13.51.1.9 TEE_CreatePersistentObject() `TEE_Result TEE_CreatePersistentObject (`
`uint32_t storageID,`
`const void * objectID,`
`uint32_t objectIDLen,`
`uint32_t flags,`
`TEE_ObjectHandle attributes,`
`const void * initialData,`
`uint32_t initialDataLen,`
`TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_CreatePersistentObject\(\)](#) - Creates a persistent object with initial attributes.

An initial data stream content, and optionally returns either a handle on the created object, or TEE_HANDLE_NULL upon failure.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>attributes</i>	A handle on a persistent object or an initialized transient object from which to take the persistent object attributes
<i>initialData</i>	The initial data content of the persistent object
<i>initialDataLen</i>	The initial data content of the persistent object
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.51.1.10 TEE_GenerateRandom() `void TEE_GenerateRandom (`
 `void * randomBuffer,`
 `uint32_t randomBufferLen)`

Crypto, common.

[TEE_GenerateRandom\(\)](#) - Generates random data.

This function generates random data of random bufferlength and is stored in to randomBuffer by calling `sgx_read_rand()`.

Parameters

<i>randomBuffer</i>	Reference to generated random data
<i>randomBufferLen</i>	Byte length of requested random data

13.51.1.11 TEE_GetObjectInfo1() `TEE_Result TEE_GetObjectInfo1 (`
 `TEE_ObjectHandle object,`
 `TEE_ObjectInfo * objectInfo)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_GetObjectInfo1\(\)](#) - Function returns the characteristics of an object.

It returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>objectInfo</i>	Pointer to a structure filled with the object information
<i>object</i>	Handle of the object

Returns

0 if success else error occurred.

13.51.1.12 TEE_GetREETime() `void TEE_GetREETime (`
 `TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetREETime\(\)](#) - Function retrieves the current REE system time.

This function retrieves the current time as seen from the point of view of the REE.

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.51.1.13 TEE_GetSystemTime() `void TEE_GetSystemTime (TEE_Time * time)`

Core Functions, Time Functions.

[TEE_GetSystemTime\(\)](#) - Retrieves the current system time.

The system time has an arbitrary implementation-defined origin that can vary across TA instances

Parameters

<i>time</i>	Filled with the number of seconds and milliseconds.
-------------	---

13.51.1.14 TEE_OpenPersistentObject() `TEE_Result TEE_OpenPersistentObject (uint32_t storageID, const void * objectID, uint32_t objectIDLen, uint32_t flags, TEE_ObjectHandle * object)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_OpenPersistentObject\(\)](#) - Opens a handle on an existing persistent object.

This function returns a handle that can be used to access the object's attributes and data stream.

Parameters

<i>storageID</i>	The storage to use.
<i>objectID</i>	The object identifier
<i>objectIDLen</i>	The object identifier
<i>flags</i>	The flags which determine the settings under which the object is opened.
<i>object</i>	A pointer to the handle, which contains the opened handle upon successful completion

Returns

0 if success, else error occurred.

13.51.1.15 TEE_ReadObjectData() `TEE_Result TEE_ReadObjectData (`
 `TEE_ObjectHandle object,`
 `void * buffer,`
 `uint32_t size,`
 `uint32_t * count)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_ReadObjectData\(\)](#) - Attempts to read size bytes from the data stream associated with the object object into the buffer pointed to by buffer.

The bytes are read starting at the position in the data stream currently stored in the object handle. The handle's position is incremented by the number of bytes actually read. On completion TEE_ReadObjectData sets the number of bytes actually read in the uint32_t pointed to by count. The value written to *count may be less than size if the number of bytes until the end-of-3067 stream is less than size. It is set to 0 if the position at the start of the read operation is at or beyond the end-of-stream. These are the only cases where *count may be less than size.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write
<i>count</i>	size of the buffer.

Returns

TEE_SUCCESS if success, else error occurred.

13.51.1.16 TEE_WriteObjectData() `TEE_Result TEE_WriteObjectData (`
 `TEE_ObjectHandle object,`
 `const void * buffer,`
 `uint32_t size)`

Core Functions, Secure Storage Functions (data is isolated for each TA)

[TEE_WriteObjectData\(\)](#) - writes size bytes from the buffer pointed to by buffer to the data stream associated with the open object handle object.

If the current data position points before the end-of-stream, then size bytes are written to the data stream, overwriting bytes starting at the current data position. If the current data position points beyond the stream's end, then the data stream is first extended with zero bytes until the length indicated by the data position indicator is reached, and then size bytes are written to the stream.

Parameters

<i>object</i>	Handle of the object
<i>buffer</i>	The buffer containing the data to be written
<i>size</i>	The number of bytes to write

Returns

TEE_SUCCESS if success else error occurred.

- void [TEEC_ReleaseSharedMemory](#) ([TEEC_SharedMemory](#) *sharedMemory)
- void [TEEC_RequestCancellation](#) ([TEEC_Operation](#) *operation)

13.58.1 Function Documentation

13.58.1.1 TEEC_AllocateSharedMemory() [TEEC_Result TEEC_AllocateSharedMemory](#) (
[TEEC_Context](#) * context,
[TEEC_SharedMemory](#) * sharedMem)

[TEEC_AllocateSharedMemory\(\)](#) - Allocate shared memory for TEE.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>sharedMem</i>	Pointer to the allocated shared memory.

Returns

TEEC_SUCCESS The registration was successful.
TEEC_ERROR_OUT_OF_MEMORY Memory exhaustion.
TEEC_Result Something failed.

13.58.1.2 TEEC_CloseSession() `void TEEC_CloseSession (`
`TEEC_Session * session)`

[TEEC_CloseSession\(\)](#) - Closes the session which has been opened with the specific trusted application.

Parameters

<i>session</i>	The opened session to close.
----------------	------------------------------

13.58.1.3 TEEC_FinalizeContext() `void TEEC_FinalizeContext (`
`TEEC_Context * context)`

[TEEC_FinalizeContext\(\)](#) - Destroys a context holding connection information on the specific TEE.

This function finalizes an initialized TEE context, closing the connection between the client application and the TEE. This function must only be called when all sessions related to this TEE context have been closed and all shared memory blocks have been released.

Parameters

<i>context</i>	The context to be finalized.
----------------	------------------------------

13.58.1.4 TEEC_InitializeContext() `TEEC_Result TEEC_InitializeContext (`
`const char * name,`
`TEEC_Context * context)`

[TEEC_InitializeContext\(\)](#) - Initializes a context holding connection information on the specific TEE, designated by the name string.

Parameters

<i>name</i>	A zero-terminated string identifying the TEE to connect to. If name is set to NULL, the default TEE is connected to. NULL is the only supported value in this version of the API implementation.
<i>context</i>	The context structure which is to be initialized.

Returns

TEEC_SUCCESS The initialization was successful.

TEEC_Result Something failed.

13.58.1.5 TEEC_OpenSession() `TEEC_Result TEEC_OpenSession (`
 `TEEC_Context * context,`
 `TEEC_Session * session,`
 `const TEEC_UUID * destination,`
 `uint32_t connectionMethod,`
 `const void * connectionData,`
 `TEEC_Operation * operation,`
 `uint32_t * returnOrigin)`

[TEEC_OpenSession\(\)](#) - Opens a new session with the specified trusted application.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>session</i>	The session to initialize.
<i>destination</i>	A structure identifying the trusted application with which to open a session.
<i>connectionMethod</i>	The connection method to use.
<i>connectionData</i>	Any data necessary to connect with the chosen connection method. Not supported, should be set to NULL.
<i>operation</i>	An operation structure to use in the session. May be set to NULL to signify no operation structure needed.
<i>returnOrigin</i>	A parameter which will hold the error origin if this function returns any value other than TEEC_SUCCESS.

Returns

TEEC_SUCCESS OpenSession successfully opened a new session.

TEEC_Result Something failed.

13.58.1.6 TEEC_RegisterSharedMemory() `TEEC_Result TEEC_RegisterSharedMemory (`
 `TEEC_Context * context,`
 `TEEC_SharedMemory * sharedMem)`

[TEEC_RegisterSharedMemory\(\)](#) - Register a block of existing memory as a shared block within the scope of the specified context.

Parameters

<i>context</i>	The initialized TEE context structure in which scope to open the session.
<i>sharedMem</i>	pointer to the shared memory structure to register.

Returns

TEEC_SUCCESS The registration was successful.
TEEC_ERROR_OUT_OF_MEMORY Memory exhaustion.
TEEC_Result Something failed.

13.58.1.7 TEEC_ReleaseSharedMemory() `void TEEC_ReleaseSharedMemory (`
`TEEC_SharedMemory * sharedMemory)`

[TEEC_ReleaseSharedMemory\(\)](#) - Free or deregister the shared memory.

Parameters

<i>sharedMem</i>	Pointer to the shared memory to be freed.
------------------	---

13.58.1.8 TEEC_RequestCancellation() `void TEEC_RequestCancellation (`
`TEEC_Operation * operation)`

[TEEC_RequestCancellation\(\)](#) - Request the cancellation of a pending open session or command invocation.

Parameters

<i>operation</i>	Pointer to an operation previously passed to open session or invoke.
------------------	--

13.59 ta-ref/api/keystone/tools.c File Reference

Functions

- static unsigned int [_strlen](#) (const char *str)
- int [puts](#) (const char *s)
- int [putchar](#) (int c)
- int [printf](#) (const char *fmt,...)

13.59.1 Function Documentation

13.59.1.1 [_strlen\(\)](#) static unsigned int [_strlen](#) (
const char * *str*) [inline], [static]

13.59.1.2 [printf\(\)](#) int [printf](#) (
const char * *fmt*,
...)

[printf\(\)](#) - Function sends formatted output to stdout.

format can optionally contain embedded format tags that are replaced by the values specified in subsequent additional arguments and formatted as requested.

Parameters

<i>fm</i>	This is the string that contains the text to be written to stdout.
-----------	--

Returns

string length If success.
0 Error occurred.

13.59.1.3 putchar() `int putchar (`
`int c)`

[putchar\(\)](#) - Function writes a character (an unsigned char) specified by the argument char to stdout.

This function returns the character written as an unsigned char cast to an int or EOF on error.

Parameters

<code>c</code>	This is the character to be written. This is passed as its int promotion.
----------------	---

Returns

size If success.
0 Error occurred.

13.59.1.4 puts() `int puts (`
`const char * s)`

[puts\(\)](#) - Function writes a string to stdout up to but not including the null character.

A newline character is appended to the output by calling [putchar\(\)](#). Compiler may replace simple printf to puts and putchar.

Parameters

<code>s</code>	This is the C string to be written
----------------	------------------------------------

Returns

size If success.
0 Error occurred.

13.60 ta-ref/api/sgx/tools.c File Reference

13.65.1 Function Documentation

13.65.1.1 [trace_printf\(\)](#) void [trace_printf](#) (

```

    const char * func,
    int line,
    int level,
    bool level_ok,
    const char * fmt,
    ... )

```

[trace_printf\(\)](#) - Prints the formatted data to stdout.

This function returns the value of ap by calling va_end().

Parameters

<i>func</i>	Pointer to a buffer where the resulting C-string is stored.
<i>line</i>	integer type of line
<i>level_ok</i>	boolean value
<i>fmt</i>	C string that contains a format string
<i>ap</i>	A value identifying a variable arguments list

Returns

Total number of characters is returned.

```
13.65.1.2  trace_vprintf()  void trace_vprintf (
    const char * func,
    int line,
    int level,
    bool level_ok,
    const char * fmt,
    va_list ap )
```

[trace_vprintf\(\)](#) - Writes the formatted data from variable argument list to sized buffer.

This function returns the buffer character by calling `ocall_print_string()`

Parameters

<i>func</i>	Pointer to a buffer where the resulting C-string is stored.
<i>line</i>	integer type of line
<i>level_ok</i>	boolean value
<i>fmt</i>	C string that contains a format string
<i>ap</i>	A value identifying a variable arguments list

Returns

buf The total number of characters written is returned.

Functions

- static unsigned int [_strlen](#) (const char *str)
- int [tee_printf](#) (const char *fmt,...)

13.66.1 Function Documentation

13.66.1.1 [_strlen\(\)](#) static unsigned int _strlen (
const char * str) [inline], [static]

[_strlen\(\)](#) - calculate the length of characters in a str.

Parameters

<i>str</i>	str is an argument of type pointer.
------------	-------------------------------------

Returns

string length on success.

13.66.1.2 [tee_printf\(\)](#) int tee_printf (
const char * fmt,
...)

[tee_printf\(\)](#) - For tracing GP API.

Initializes ap variable. Formats data under control of the format control string and stores the result in buf and ends the processing of ap. Finally print the buffer value.

Parameters

<i>fmt</i>	fmt is a constant character argument of type pointer.
------------	---

Returns

buffer If successfully executed, else error occurred.

13.67 ta-ref/api/keystone/trace2.c File Reference

```
#include <stdarg.h>
#include <stdio.h>
```

Include dependency graph for trace2.c:

Functions

- static unsigned int [_strlen](#) (const char *str)
- int [tee_printf](#) (const char *fmt,...)

13.67.1 Function Documentation

13.67.1.1 [_strlen\(\)](#) static unsigned int [_strlen](#) (
const char * *str*) [inline], [static]

[_strlen\(\)](#) - calculate the length of characters in str.

Parameters

<i>str</i>	str is argument of type pointer.
------------	----------------------------------

Returns

string string length.

13.67.1.2 [tee_printf\(\)](#) int [tee_printf](#) (
const char * *fmt*,
...)

[tee_printf\(\)](#) - For trace GP API.

Initializes ap variable. Formats data under control of the format control string and stores the result in buf and ends the processing of ap. Finally prints the buffer value.

Parameters

<i>fmt</i>	<i>fmt</i> is constant character argument of type pointer.
------------	--

Returns

res Based on the condition check it will return string length else returns 0.

13.68 ta-ref/api/sgx/trace2.c File Reference

- void [trace_printf](#) (const char *func, int line, int level, bool level_ok, const char *fmt,...)

13.68.1 Function Documentation

13.68.1.1 trace_printf() void trace_printf (

```

    const char * func,
    int line,
    int level,
    bool level_ok,
    const char * fmt,
    ... )
```

[trace_printf\(\)](#) - Prints the formatted data to stdout.

This function returns the value of ap by calling va_end().

Parameters

<i>func</i>	Pointer to a buffer where the resulting C-string is stored.
<i>line</i>	integer type of line
<i>level_ok</i>	boolean value
<i>fmt</i>	C string that contains a format string
<i>ap</i>	A value identifying a variable arguments list

Returns

Total number of characters is returned.

```
13.68.1.2 trace_vprintf() void trace_vprintf (
    const char * func,
    int line,
    int level,
    bool level_ok,
    const char * fmt,
    va_list ap )
```

[trace_vprintf\(\)](#) - Writes the formatted data from variable argument list to sized buffer.

This function returns the buffer character by calling ocall_print_string()

Parameters

<i>func</i>	Pointer to a buffer where the resulting C-string is stored.
<i>line</i>	integer type of line
<i>level_ok</i>	boolean value
<i>fmt</i>	C string that contains a format string
<i>ap</i>	A value identifying a variable arguments list

Returns

buf The total number of characters written is returned.

13.70.3 Function Documentation

13.70.3.1 _atoi() `static unsigned int _atoi (const char ** str) [static]`

[_atoi\(\)](#) - Converts the internal ASCII string into an unsigned integer.

This function is to convert the internal ASCII string into unsigned integer.

Parameters

<i>str</i>	string representation of an integral number.
------------	--

Returns

i unsigned integer value.

```

13.70.3.2  _ftoa()  static size_t _ftoa (
    out_fct_type out,
    char * buffer,
    size_t idx,
    size_t maxlen,
    double value,
    unsigned int prec,
    unsigned int width,
    unsigned int flags )  [static]

```

_ftoa() - Converts a given floating-point number or a double to a string with the use of standard library functions.

This function checks whether the value is negative or not, then it checks with if condition default precision to 6, if it not set it will set explicitly. Using the while loop it limits the precision to 9, because it causes a overflow error when precision crosses above 10. Using the if condition rollover or round If the precison value is greater than 0.5 up the precision value.it round up to

1. Using the while_loop condition adding extra zeros and append decimal value to the length. Finally using the conditional statement executes pad leading zeros, handling the hash value, padding spaces up to given width and reverses the string.

Parameters

<i>out</i>	type of out_fct_type
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	idx bytes of size_t
<i>maxlen</i>	Maximum number of characters to write.
<i>negative</i>	boolean type
<i>base</i>	an unsigned long data type
<i>prec</i>	an unsigned integral data type
<i>width</i>	an unsigned integral data type
<i>flags</i>	an unsigned integral data type

Returns

non integer value if success else error occur

```

13.70.3.3  _is_digit()  static bool _is_digit (
    char ch )  [inline], [static]

```

_is_digit() - Is for the internal test if char is a digit from 0 to 9

Parameters

<i>ch</i>	This is the character to be checked.
-----------	--------------------------------------

Returns

true if char is a digit and internal test if char is a digit from 0 to 9

13.70.3.4 `_ntoa_format()` static size_t _ntoa_format (

```

    out_fct_type out,
    char * buffer,
    size_t idx,
    size_t maxlen,
    char * buf,
    size_t len,
    bool negative,
    unsigned int base,
    unsigned int prec,
    unsigned int width,
    unsigned int flags ) [static]

```

`_ntoa_format()` - Converts the string into the defined format structure.

This function uses the while condition for padding the leading zeroes and also applies the if conditions to handle the hash. Using the if condition pad spaces up to given width what specifies in that. It reverse the string and again append pad spaces up to given width.

Parameters

<i>out</i>	type of out_fct_type
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	idx bytes of size_t
<i>maxlen</i>	Maximum number of characters to write.
<i>negative</i>	boolean type
<i>base</i>	an unsigned long data type
<i>prec</i>	an unsigned integer data type
<i>width</i>	an unsigned integer data type
<i>flags</i>	an unsigned integer data type

Returns

idx non integer value if success else error occur.

13.70.3.5 `_ntoa_long()` static size_t _ntoa_long (

```

    out_fct_type out,
    char * buffer,
    size_t idx,
    size_t maxlen,
    unsigned long value,
    bool negative,
    unsigned long base,

```

```

    unsigned int prec,
    unsigned int width,
    unsigned int flags ) [static]

```

[_ntoa_long\(\)](#) - Converts string into long value.

This function begins with an if condition value then it assigns ~FLAGS_HASH into flags & value. Later it uses the if condition and do while write if precision not equal to zero and value is not equals to zero.

Parameters

<i>out</i>	type of out_fct_type
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	idx bytes of size_t
<i>maxlen</i>	Maximum number of characters to write.
<i>negative</i>	boolean type
<i>base</i>	an unsigned long data type
<i>prec</i>	an unsigned integral data type
<i>width</i>	an unsigned integral data type
<i>flags</i>	an unsigned integral data type

Returns

idx non integer value if success else error occur.

13.70.3.6 [_ntoa_long_long\(\)](#) static size_t _ntoa_long_long (

```

    out_fct_type out,
    char * buffer,
    size_t idx,
    size_t maxlen,
    unsigned long long value,
    bool negative,
    unsigned long long base,
    unsigned int prec,
    unsigned int width,
    unsigned int flags ) [static]

```

[_ntoa_long_long\(\)](#) - Function to convert string to long value.

This function begins with an if condition then it assigns ~FLAGS_HASH into flags & value. Later it uses the if condition and do while write if precision not equal to zero and value is not equals to zero.

Parameters

<i>out</i>	type of out_fct_type
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	idx bytes of size_t
<i>maxlen</i>	Maximum number of characters to write.
Paramter list continued on next page	

<i>negative</i>	boolean type
<i>base</i>	an unsigned long data type
<i>prec</i>	an unsigned integral data type
<i>width</i>	an unsigned integral data type
<i>flag</i>	an unsigned integral data type

Returns

idx non integer value if success else error occur.

13.70.3.7 `_out_buffer()` static void `_out_buffer` (
 char *character*,
 void * *buffer*,
 size_t *idx*,
 size_t *maxlen*) [inline], [static]

[_out_buffer\(\)](#) - Internal buffer output

This function compares the idx and maxlen, If "idx" is less than "maxlen" then it will assign "character" value into the typecasting char "buffer[idx]"

Parameters

<i>character</i>	character type string
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	bytes of size_t
<i>maxlen</i>	Maximum number of characters to write.

13.70.3.8 `_out_char()` static void `_out_char` (
 char *character*,
 void * *buffer*,
 size_t *idx*,
 size_t *maxlen*) [inline], [static]

[_out_char\(\)](#) - Internal putchar wrapper

The typecasting of arguments with void is to avoid unused variable warnings in some compilers. Checks the character value once the if condition is success then [putchar\(\)](#) writes a character into stdout.

Parameters

<i>character</i>	character type string
Paramter list continued on next page	

<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	bytes of <code>size_t</code>
<i>maxlen</i>	Maximum number of characters to write.

13.70.3.9 `_out_fct()` `static void _out_fct (`
 `char character,`
 `void * buffer,`
 `size_t idx,`
 `size_t maxlen) [inline], [static]`

[_out_fct\(\)](#) - Internal output function wrapper

This function typecasting `idx` and `maxlen` arguments is to avoid compiler error. And then output function wrapper and the buffer is the output fct pointer.

Parameters

<i>character</i>	character type string
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	bytes of <code>size_t</code>
<i>maxlen</i>	Maximum number of characters to write.

13.70.3.10 `_out_null()` `static void _out_null (`
 `char character,`
 `void * buffer,`
 `size_t idx,`
 `size_t maxlen) [inline], [static]`

[_out_null\(\)](#) - Internal null output.

The typecasting of arguments with `void` is applied to avoid unused variable warnings in some compilers.

Parameters

<i>character</i>	character type string
<i>buffer</i>	Pointer to a character string to write the result.
<i>idx</i>	bytes of <code>size_t</code>
<i>maxlen</i>	Maximum number of characters to write.

13.70.3.11 `_strlen()` `static unsigned int _strlen (`
`const char * str) [inline], [static]`

`_strlen()` - calculates the length of the string.

Parameters

<i>str</i>	str is an argument of type pointer.
------------	-------------------------------------

Returns

string length if successfully executed, else error occurred.

13.70.3.12 `_vsnprintf()` `static int _vsnprintf (`
`out_fct_type out,`
`char * buffer,`
`const size_t maxlen,`
`const char * format,`
`va_list va) [static]`

`_vsnprintf()` - Function writes formatted output to a character array, up to a maximum number of characters.

The `_vsnprintf` function firstly initializes the variables of format specifiers like flags, width, precision in this they evaluate all the specifiers individually. First it checks the buffer equal to zero or not for null output function. After that flags evaluation will start using the switch case, then width field evaluation takes process using if condition.

Parameters

<i>out</i>	type of out_fct_type.
<i>buffer</i>	pointer to the buffer where you want to function to store the formatted string.
<i>maxlen</i>	maximum number of characters to store in the buffer.
<i>format</i>	string that specifies the format of the output.
<i>va</i>	variable-argument list of the additional argument.

Returns

Its return the typecasted int of idx if success otherwise error occurred.

13.70.3.13 `fctprintf()` `int fctprintf (`
`void(*) (char character, void *arg) out,`
`void * arg,`
`const char * format,`
`...)`

`fprintf()` - Function is using the library macros of variable arguments like `vstart` and `vaend`.

This function initializes the `va_list` variable and invokes the `va_start()`. Invokes `_vsnprintf` function and stores the value into `ret`. It applies the functions `va_start` and `va_end` on `va` and returns `ret`.

Parameters

<i>out</i>	An output function which takes one character and an argument pointer.
<i>arg</i>	An argument pointer for user data passed to output function.
<i>format</i>	A string that specifies the format of the output.

Returns

The number of characters that are sent to the output function, not counting the terminating null character.

13.70.3.14 putchar() `int putchar (`
 `char ch)`

13.70.3.15 snprintf() `int snprintf (`
 `char * buffer,`
 `size_t count,`
 `const char * format,`
 `...)`

[snprintf\(\)](#) - Places the generated output into the character array pointed to by buf, instead of writing it to a file

This function initializes the va_list variable and invokes the va_start(). Invokes _vsnprintf function and stores the value into ret. It applies the functions va_start and va_end on va and returns ret.

Parameters

<i>buffer</i>	pointer to buffer where you want to function to store the formatted string.
<i>count</i>	maximum number of characters to store in the buffer.
<i>format</i>	string that specifies the format of the output.

Returns

ret returns the ret value as an integer type.

13.70.3.16 sprintf() `int sprintf (`
 `char * buffer,`
 `const char * format,`
 `...)`

[sprintf\(\)](#) - Sends formatted output to a string pointed to by the argument buffer.

This function initialize the `va_list` variable and invokes the `va_start()`. Invokes `_vsnprintf` function and store the value into `ret`. It applies the functions `va_start` and `va_end` on `va` and returns `ret`.

Parameters

<i>buffer</i>	pointer to an array of char elements resulting string will store.
<i>format</i>	string that contains the text to be written to buffer.

Returns

ret It returns the ret value as an integer type.

13.70.3.17 vsnprintf() int vsnprintf (
 char * *buffer*,
 size_t *count*,
 const char * *format*,
 va_list *va*)

[vsnprintf\(\)](#) - Invokes another function called [_vsnprintf\(\)](#). with some arguments.

Parameters

<i>buffer</i>	Pointer to the buffer where you want to function to store the formatted string.
<i>count</i>	maximum number of characters to store in the buffer.
<i>format</i>	string that specifies the format of the output.

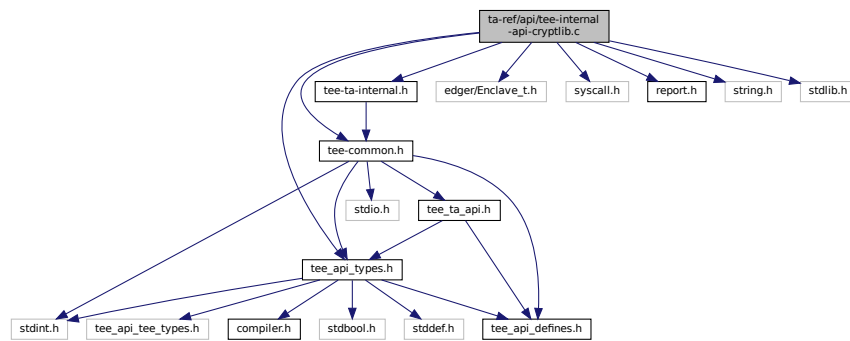

Returns

Its return the typecasted int of idx if success otherwise error occurred.

13.71.1 Function Documentation

13.71.1.1 TEE_AEDecryptFinal() [TEE_Result](#) TEE_AEDecryptFinal (
[TEE_OperationHandle](#) operation,
const void * srcData,
[uint32_t](#) srcLen,
void * destData,
[uint32_t](#) * destLen,
void * tag,
[uint32_t](#) tagLen)

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEDecryptFinal\(\)](#) - Processes data that has not been processed by previous calls to [TEE_AEUpdate](#) as well as data supplied in srcData.

This function completes the AE operation and compares the computed tag with the tag supplied in the parameter tag. The operation handle can be reused or newly initialized. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output

TEE_ERROR_MAC_INVALID If the computed tag does not match the supplied tag

13.71.1.2 TEE_AEEncryptFinal() `TEE_Result TEE_AEEncryptFinal (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen,`
`void * tag,`
`uint32_t * tagLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEEncryptFinal\(\)](#) - processes data that has not been processed by previous calls to [TEE_AEUpdate](#) as well as data supplied in `srcData` .

[TEE_AEEncryptFinal](#) completes the AE operation and computes the tag. The operation handle can be reused or newly initialized. The buffers `srcData` and `destData` SHALL be either completely disjoint or equal in their starting positions. The operation may be in either initial or active state and enters initial state afterwards.

Parameters

<i>operation</i>	Handle of a running AE operation
<i>srcData</i>	Reference to final chunk of input data to be encrypted
<i>srcLen</i>	length of the input data
<i>destData</i>	Output buffer. Can be omitted if the output is to be discarded.
<i>destLen</i>	length of the buffer.
<i>tag</i>	Output buffer filled with the computed tag
<i>tagLen</i>	length of the tag.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER If the output or tag buffer is not large enough to contain the output.

13.71.1.3 TEE_AEInit() `TEE_Result TEE_AEInit (`
`TEE_OperationHandle operation,`
`const void * nonce,`
`uint32_t nonceLen,`
`uint32_t tagLen,`
`uint32_t AADLen,`
`uint32_t payloadLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEInit\(\)](#) - Initializes an Authentication Encryption operation.

The operation must be in initial state and remains in the initial state afterwards.

Parameters

<i>operation</i>	A handle on the operation.
<i>nonce</i>	The operation nonce or IV
<i>nonceLen</i>	length of nonce
<i>tagLen</i>	Size in bits of the tag
<i>AADLen</i>	Length in bytes of the AAD
<i>payloadLen</i>	Length in bytes of the payload.

Returns

0 on success.

TEE_ERROR_NOT_SUPPORTED If the tag length is not supported by the algorithm.

13.71.1.4 TEE_AEUpdate() `TEE_Result TEE_AEUpdate (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEUpdate\(\)](#) - Accumulates data for an Authentication Encryption operation

This function describes Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. when using this routine to decrypt the returned data may be corrupt since the integrity check is not performed until all the data has been processed. If this is a concern then only use the TEE_AEDecryptFinal routine.

Parameters

<i>operation</i>	Handle of a running AE operation.
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of the input buffer.
<i>destData</i>	Output buffer
<i>destLen</i>	length of the out put buffer.

Returns

0 on success.

TEE_ERROR_SHORT_BUFFER if the output buffer is not large enough to contain the output.

13.71.1.5 TEE_AEUpdateAAD() `void TEE_AEUpdateAAD (`
`TEE_OperationHandle operation,`
`const void * AADdata,`
`uint32_t AADdataLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_AEUpdateAAD\(\)](#) - Feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible.

The TEE_AEUpdateAAD function feeds a new chunk of Additional Authentication Data (AAD) to the AE operation. Subsequent calls to this function are possible. The buffers srcData and destData shall be either completely disjoint or equal in their starting positions. The operation SHALL be in initial state and remains in initial state afterwards.

Parameters

<i>operation</i>	Handle on the AE operation
<i>AADdata</i>	Input buffer containing the chunk of AAD
<i>AADdataLen</i>	length of the chunk of AAD.

13.71.1.6 TEE_AllocateOperation() `TEE_Result TEE_AllocateOperation (`
`TEE_OperationHandle * operation,`
`uint32_t algorithm,`
`uint32_t mode,`
`uint32_t maxKeySize)`

Crypto, for all Crypto Functions.

[TEE_AllocateOperation\(\)](#) - Allocates a handle for a new cryptographic operation and sets the mode and algorithm type.

If this function does not return with TEE_SUCCESS then there is no valid handle value. Once a cryptographic operation has been created, the implementation shall guarantee that all resources necessary for the operation are allocated and that any operation with a key of at most maxKeySize bits can be performed. For algorithms that take multiple keys, for example the AES XTS algorithm, the maxKeySize parameter specifies the size of the largest key. It is up to the implementation to properly allocate space for multiple keys if the algorithm so requires.

Parameters

<i>operation</i>	reference to generated operation handle.
<i>algorithm</i>	One of the cipher algorithms.
<i>mode</i>	The operation mode.
<i>maxKeySize</i>	Maximum key size in bits for the operation.

Returns

0 in case of success

TEE_ERROR_OUT_OF_MEMORY If there are not enough resources to allocate the operation.

TEE_ERROR_NOT_SUPPORTED If the mode is not compatible with the algorithm or key size or if the algorithm is not one of the listed algorithms or if maxKeySize is not appropriate for the algorithm.

13.71.1.7 TEE_AllocateTransientObject() `TEE_Result TEE_AllocateTransientObject (`
`TEE_ObjectType objectType,`
`uint32_t maxKeySize,`
`TEE_ObjectHandle * object)`

Crypto, Asymmetric key Verification Functions.

[TEE_AllocateTransientObject\(\)](#) - Allocates an uninitialized transient object. Transient objects are used to hold a cryptographic object (key or key-pair).

The value TEE_KEYSIZE_NO_KEY should be used for maxObjectSize for object types that do not require a key so that all the container resources can be pre-allocated. As allocated, the container is uninitialized. It can be initialized by subsequently importing the object material, generating an object, deriving an object, or loading an object from the Trusted Storage.

Parameters

<i>objectType</i>	Type of uninitialized object container to be created
<i>maxKeySize</i>	Key Size of the object.
<i>object</i>	Filled with a handle on the newly created key container.

Returns

0 on success

TEE_ERROR_OUT_OF_MEMORY If not enough resources are available to allocate the object handle.

TEE_ERROR_NOT_SUPPORTED If the key size is not supported or the object type is not supported.

13.71.1.8 TEE_AsymmetricSignDigest() `TEE_Result TEE_AsymmetricSignDigest (`
`TEE_OperationHandle operation,`
`const TEE_Attribute * params,`
`uint32_t paramCount,`
`const void * digest,`
`uint32_t digestLen,`
`void * signature,`
`uint32_t * signatureLen)`

Crypto, Asymmetric key Verification Functions.

[TEE_AsymmetricSignDigest\(\)](#) - Signs a message digest within an asymmetric operation.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the signature buffer is not large enough to hold the result

13.71.1.9 TEE_AsymmetricVerifyDigest() `TEE_Result TEE_AsymmetricVerifyDigest (`
`TEE_OperationHandle operation,`
`const TEE_Attribute * params,`
`uint32_t paramCount,`
`const void * digest,`
`uint32_t digestLen,`
`const void * signature,`
`uint32_t signatureLen)`

Crypto, Asymmetric key Verification Functions.

[TEE_AsymmetricVerifyDigest\(\)](#) - verifies a message digest signature within an asymmetric operation.

This function describes the message digest signature verify by calling `ed25519_verify()`.

Parameters

<i>operation</i>	Handle on the operation, which SHALL have been suitably set up with an operation key.
<i>params</i>	Optional operation parameters
<i>paramCount</i>	size of param.
<i>digest</i>	Input buffer containing the input message digest
<i>digestLen</i>	length of input buffer.
<i>signature</i>	Output buffer written with the signature of the digest
<i>signatureLen</i>	length of output buffer.

Returns

TEE_SUCCESS on success

TEE_ERROR_SIGNATURE_INVALID if the signature is invalid.

13.71.1.10 TEE_CipherDoFinal() `TEE_Result TEE_CipherDoFinal (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen)`

[TEE_CipherDoFinal\(\)](#) - Finalizes the cipher operation, processing data that has not been processed by previous calls to [TEE_CipherUpdate](#) as well as data supplied in `srcData` .

This function describes The operation handle can be reused or re-initialized. The buffers `srcData` and `destData` shall be either completely disjoint or equal in their starting positions. The operation SHALL be in active state and is set to initial state afterwards.

Parameters

<i>operation</i>	Handle of a running Cipher operation
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of input buffer
<i>destData</i>	output buffer
<i>destLen</i>	ouput buffer length.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the output buffer is not large enough to contain the output

13.71.1.11 TEE_CipherInit() `void TEE_CipherInit (`
`TEE_OperationHandle operation,`
`const void * nonce,`
`uint32_t nonceLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_CipherInit\(\)](#) - starts the symmetric cipher operation.

The operation shall have been associated with a key. If the operation is in active state, it is reset and then initialized. If the operation is in initial state, it is moved to active state.

Parameters

<i>operation</i>	A handle on an opened cipher operation setup with a key
<i>nonce</i>	Buffer containing the operation Initialization Vector as appropriate.
<i>nonceLen</i>	length of the buffer

13.71.1.12 TEE_CipherUpdate() `TEE_Result TEE_CipherUpdate (`
`TEE_OperationHandle operation,`
`const void * srcData,`
`uint32_t srcLen,`
`void * destData,`
`uint32_t * destLen)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_CipherUpdate\(\)](#) - encrypts or decrypts input data.

Input data does not have to be a multiple of block size. Subsequent calls to this function are possible. Unless one or more calls of this function have supplied sufficient input data, no output is generated. The cipher operation is finalized with a call to `TEE_CipherDoFinal`. The buffers `srcData` and `destData` SHALL be either completely disjoint or equal in their starting positions. The operation SHALL be in active state.

Parameters

<i>operation</i>	Handle of a running Cipher operation
<i>srcData</i>	Input data buffer to be encrypted or decrypted
<i>srcLen</i>	length of input buffer
<i>destData</i>	output buffer
<i>destLen</i>	output buffer length.

Returns

0 on success else

`TEE_ERROR_SHORT_BUFFER` If the output buffer is not large enough to contain the output. In this case, the input is not fed into the algorithm.

13.71.1.13 TEE_DigestDoFinal() `TEE_Result TEE_DigestDoFinal (`
`TEE_OperationHandle operation,`
`const void * chunk,`
`uint32_t chunkLen,`
`void * hash,`
`uint32_t * hashLen)`

[TEE_DigestDoFinal\(\)](#) - Finalizes the message digest operation and produces the message hash.

This function finalizes the message digest operation and produces the message hash. Afterwards the Message Digest operation is reset to initial state and can be reused.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed.
<i>chunkLen</i>	size of the chunk.
<i>hash</i>	Output buffer filled with the message hash.
<i>hashLen</i>	length of the message hash.

Returns

0 on success

TEE_ERROR_SHORT_BUFFER If the output buffer is too small. In this case, the operation is not finalized.

13.71.1.14 TEE_DigestUpdate() void TEE_DigestUpdate (
 TEE_OperationHandle operation,
 const void * chunk,
 uint32_t chunkSize)

Crypto, Message Digest Functions.

[TEE_DigestUpdate\(\)](#) - Accumulates message data for hashing.

This function describes the message does not have to be block aligned. Subsequent calls to this function are possible. The operation may be in either initial or active state and becomes active.

Parameters

<i>operation</i>	Handle of a running Message Digest operation.
<i>chunk</i>	Chunk of data to be hashed
<i>chunkSize</i>	size of the chunk.

13.71.1.15 TEE_FreeOperation() void TEE_FreeOperation (
 TEE_OperationHandle operation)

Crypto, for all Crypto Functions.

[TEE_FreeOperation\(\)](#) - Deallocates all resources associated with an operation handle.

This function deallocates all resources associated with an operation handle. After this function is called, the operation handle is no longer valid. All cryptographic material in the operation is destroyed. The function does nothing if operation is TEE_HANDLE_NULL.

Parameters

<i>operation</i>	Reference to operation handle.
------------------	--------------------------------

Returns

nothing after the operation free.

13.71.1.16 TEE_FreeTransientObject() `void TEE_FreeTransientObject (`
`TEE_ObjectHandle object)`

Crypto, Asymmetric key Verification Functions.

[TEE_FreeTransientObject\(\)](#) - Deallocates a transient object previously allocated with [TEE_AllocateTransientObject](#).

this function describes the object handle is no longer valid and all resources associated with the transient object shall have been reclaimed after the [TEE_AllocateTransientObject\(\)](#) call.

Parameters

<i>object</i>	Handle on the object to free.
---------------	-------------------------------

13.71.1.17 TEE_GenerateKey() `TEE_Result TEE_GenerateKey (`
`TEE_ObjectHandle object,`
`uint32_t keySize,`
`const TEE_Attribute * params,`
`uint32_t paramCount)`

Crypto, Asymmetric key Verification Functions.

[TEE_GenerateKey\(\)](#) - Generates a random key or a key-pair and populates a transient key object with the generated key material.

The size of the desired key is passed in the `keySize` parameter and shall be less than or equal to the maximum key size specified when the transient object was created.

Parameters

<i>object</i>	Handle on an uninitialized transient key to populate with the generated key.
<i>keySize</i>	Requested key size shall be less than or equal to the maximum key size specified when the object container was created
<i>params</i>	Parameters for the key generation.
<i>paramCount</i>	The values of all parameters are copied into the object so that the params array and all the memory buffers it points to may be freed after this routine returns without affecting the object.

Returns

0 on success

`TEE_ERROR_BAD_PARAMETERS` If an incorrect or inconsistent attribute is detected. The checks that are performed depend on the implementation.

13.71.1.18 TEE_InitRefAttribute() `void TEE_InitRefAttribute (`
 `TEE_Attribute * attr,`
 `uint32_t attributeID,`
 `const void * buffer,`
 `uint32_t length)`

Crypto, Asymmetric key Verification Functions.

[TEE_InitRefAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

In `TEE_InitRefAttribute ()` only the buffer pointer is copied, not the content of the buffer. This means that the attribute structure maintains a pointer back to the supplied buffer. It is the responsibility of the TA author to ensure that the contents of the buffer maintain their value until the attributes array is no longer in use.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>buffer</i>	input buffer that holds the content of the attribute.
<i>length</i>	buffer length.

13.71.1.19 TEE_InitValueAttribute() `void TEE_InitValueAttribute (`
 `TEE_Attribute * attr,`
 `uint32_t attributeID,`
 `uint32_t a,`
 `uint32_t b)`

Crypto, Asymmetric key Verification Functions.

[TEE_InitValueAttribute\(\)](#) - The helper function can be used to populate a single attribute either with a reference to a buffer or with integer values.

Parameters

<i>attr</i>	attribute structure to initialize.
<i>attributeID</i>	Identifier of the attribute to populate.
<i>a</i>	unsigned integer value to assign to the a member of the attribute structure.
<i>b</i>	unsigned integer value to assign to the b member of the attribute structure

13.71.1.20 TEE_SetOperationKey() `TEE_Result TEE_SetOperationKey (`
 `TEE_OperationHandle operation,`
 `TEE_ObjectHandle key)`

Crypto, Authenticated Encryption with Symmetric key Verification Functions.

[TEE_SetOperationKey\(\)](#) - Programs the key of an operation; that is, it associates an operation with a key.

The key material is copied from the key object handle into the operation. After the key has been set, there is no longer any link between the operation and the key object. The object handle can be closed or reset and this will not affect the operation. This copied material exists until the operation is freed using [TEE_FreeOperation](#) or another key is set into the operation.

Parameters

<i>operation</i>	Operation handle.
<i>key</i>	A handle on a key object.

Returns

0 on success return

[TEE_ERROR_CORRUPT_OBJECT](#) If the object is corrupt. The object handle is closed.

[TEE_ERROR_STORAGE_NOT_AVAILABLE](#) If the persistent object is stored in a storage area which is currently inaccessible.

13.71.1.21 [wolfSSL_Free\(\)](#) `void wolfSSL_Free (`
`void * p)`

[wolfSSL_Free\(\)](#) - Deallocates the memory which allocated previously.

Parameters

<i>p</i>	This is the pointer to a memory block.
----------	--

13.71.1.22 [wolfSSL_Malloc\(\)](#) `void * wolfSSL_Malloc (`
`size_t n)`

[wolfSSL_Malloc\(\)](#) - Allocates the requested memory and returns a pointer to it.

Parameters

<i>n</i>	size of the memory block.
